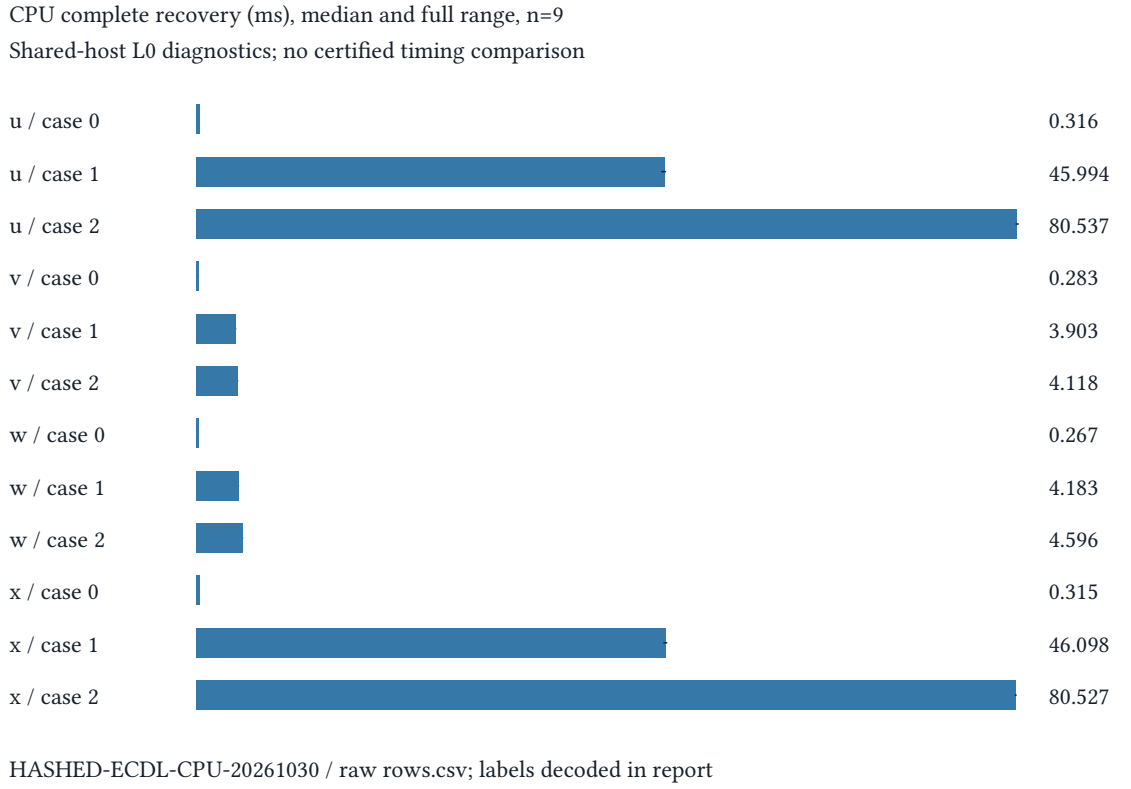
CPU complete recovery: parameter cache

Observations only; no hypothesis promotion or certified latency claim. Run: `hashed-ecdl-cpu-panel2-20261030`, October 29, 2026 PDT.

The cache compares the four validated curve parameters and exact bases, avoiding comparison or cloning of the small-field root table. It retains lexicographic prefix/suffix sums across targets and batches residual inversions. All arms use the same updated shared reduction and one frozen native binary. Host: AMD EPYC 9R45, one software thread, two reserved vCPUs and 4 GiB, shared EKS VM, L0.

Fixture	Original u, ms	Cached v, ms	A/A x, ms
8-bit / 3 slots	0.315901	0.283191	0.314862
16-bit / 3 slots	45.993793	3.903194	46.098433
16-bit / 4 slots	80.536765	4.118365	80.527314

Medians from 9 measured repetitions after 1 warmup per cell. The observed median ratios u/v are approximately 1.12, 11.78, 19.56; these are descriptive divisions, not certified speedups. The full ranges appear below and in `summary.csv`.



All 120 executions completed,108 measured and12 warmups. The frozen analyzer compared every complete certificate byte-for-byte across all four arms. Every execution checked the recovered scalar, independently replayed its certificate and rejected a corrupted scalar. Batch1 medians were 0.267431, 4.182565, 4.595888 ms; batch 64 does extra work past the first hit in a batch and is not always fastest on the smallest fixture. All work in the batch remains charged.

The complete interval includes curve and known-target construction, full solve and all failed attempts/trials, two certificate checks and serialization. It excludes launch, archive I/O and the negative control. Retained table capacities are recorded; total peak RSS is not measured. Matched rho/external baselines and strict CPU isolation are missing, so no fastest-tool or cryptographic-size claim is supported. These are single-target generic-decomposition workloads.

Source `abfd53ec854c`; full source/binary identities: `panel2/results/build.json`. Protocol: `5addf86ce983b867a869ee37c9a0a3c309566082cdb05fa2e0e46b60d4195035`. Records: `panel2/results/export.json`, `rows.csv`, `summary.csv` and certificates. Do not pool with panel1: the shared reduction changed between panels. Within this panel the oracle is the only treatment factor. Larger-field feasibility is reported separately by the bounded public-target CPU ladder.
