Funding and live-cap readback: November 5, 2026

Read-only observation window: 15:46–15:47 UTC. No build, trial, role change or cluster mutation occurred.

Delayed AWS budget observations

Budget	Limit USD	Reported USD	Last updated UTC
Daily primary	200	104.44	11:47:42
Daily alternate	200	44.765	11:51:51
Monthly	1000	538.72	11:55:08

The two daily thresholds are nonadditive. Arithmetic residuals are 95.56 USD conservatively for the daily snapshots and 461.28 USD monthly, before billing delay and commitments. Actual available funds remain unknown.

Admission observation diagram

AWS snapshots available, delayed ⟶ commitments unresolved.
Live NodePool, quota and ARC readbacks ⟶ role assumption denied.
Combined observation ⟶ no execution admission.

The configured context named `spot-job-submitter` invokes a legacy LauncherRole. The current WorkerRole was denied `sts:AssumeRole` before Kubernetes RBAC evaluation. Failed empty Lists are not evidence of an empty cluster. No additional role was attempted.

The separately configured IsoLab MCP overview returned twelve retained jobs: ten failed, one succeeded and one suspended. No active pencil job was returned. This list is not an account-wide census; its compiled pool limits are not live enforcement.

Next admission dependencies

Obtain authorized live pool/quota/ARC readback and reconcile committed, reserved, idle, storage, transfer and failed-attempt costs. Preserve the reviewed source/image/protocol/runtime gates. The time authorization alone does not allocate dollars.

Evidence and editable outputs

Exact commands, timestamps, exits and stdout/stderr hashes are in per-command receipts. Structured values: `summary.json`; table: `budgets.csv`; editable diagram: `admission.svg`. Source runbook: `COST_CONTROLS.md` in the owner cost-controls checkout. No comparative scientific result is asserted.
