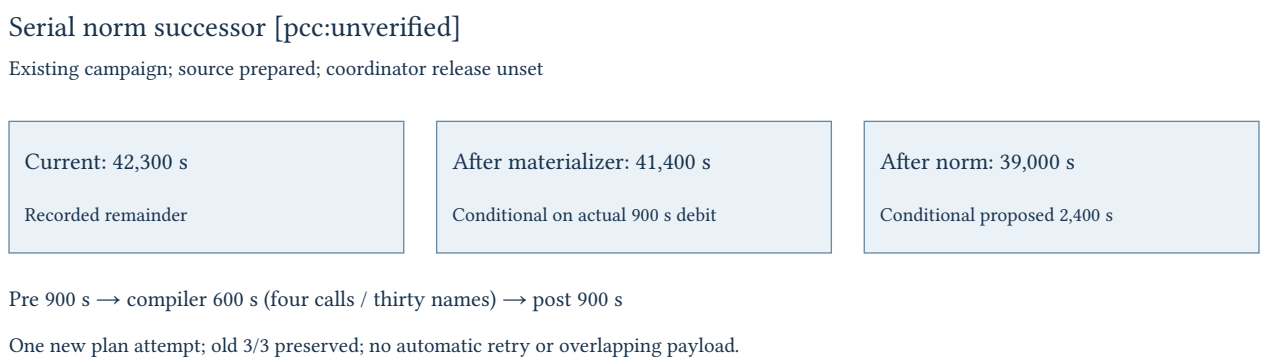
Norm successor amendment

[pcc:unverified] Source prepared under the existing campaign; no runtime release or payload.



Authority and preserved history

Original V3 CONTINUATION requires a new prospective plan within the existing budget for further attempts. Historical three-of-three remains consumed; it is not a user-imposed lifetime cap. Coordinator audit withdrew the erroneous additional-user-consent gate. Existing 46,800-second campaign and November 6, 04:00 UTC deadline remain unchanged.

Scope and source change

One fresh 900/600/900-second pipeline with original four Lean calls, thirty named axiom readbacks, parser controls, intended negative rejection and complete native pre/post custody. Only the reviewed IndependentControls correction changes mathematical input. Original producer/readback/negative sources and runtime closure stay pinned. No later finite, branch or base-multiplicity modules are added.

Serial admission

Current remainder stays 42,300 until materializer termination and its 900-second debit are actually recorded. Conditional 41,400 precedes this attempt; proposed 2,400 leaves 39,000. No allowance is reserved by this source preparation. No overlap or automatic retry. One CPU, 8 GiB RAM, zero swap and 128 tasks remain.

Release record and runtime ownership

The existing launcher admission boundary requires a hash-pinned coordinator release and actual hashed publication, independent review, ledger, serial terminal and lease-readback receipts. The template is false/null. Coordinator must authenticate those receipts and maintain the live lease. Original bounded phase supervision, invocation identity, manager-journal termination and cleanup remain. No new submission framework is introduced.

Evidence limits

This is source preparation and artifact hashing, not compiler/runtime validation. Previous failed controls and their costs remain recorded. Independently reviewed correction is still uncompiled. Separate exact publication, prospective review and coordinator release precede execution. KB unavailable; exact primary source reused. Full details and source hashes are in PLAN.md, bindings.json and freeze.json.
