Actual nodes t = m - 2^a
exact valuation i: 2^(a-i) nodes
Actual h = ceil(3 M / u)
q(t) = h max(0, u - v2(t)); exclude t = 0
Full per-node sum of q(t)
exceeds 2 M (2 L - 1), for 3 <= u <= a, u <= M
Unit node differences + monic products
exact Taylor jet uniqueness; nilpotents allowed
Actual source chart t + 2 L z
exact jets determine actual cleared polynomial
exact Q-algebra cancellation alone is insufficient
OPEN: finite-precision Hermite multipliers
valuation and bit-cost theorem
