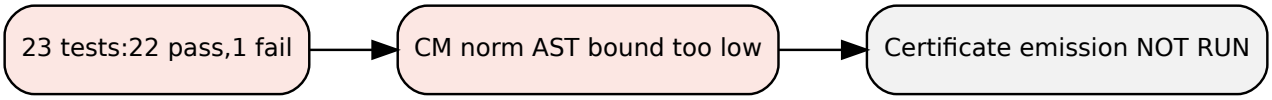
Preserved algebra-01 failure

2026-11-12 · PCC-20261112-5f671c · scientific standing unsigned

23 tests:22 pass,1 fail. CM norm AST bound too low;Certificate emission NOT RUN. This attempt is not accepted as a mathematical proof or complete native result. [pcc:unverified]



The diagram shows execution stages;there are no comparable timing arms.

Diagnosis and exact correction

The new CM norm expression has syntactic AST degree7 before cancellation but declares6. The unchanged checker rejects malformed input before the mutation can receive the required False verdict. Raise only this new bound to its actual syntax degree7;retain the False-mutation requirement and every original test. The successful retry passes23 and emits all five certificates,with the old two byte-identical. [pcc:unverified]

Custody and acceptance boundaries

The full failed source,diagnostics,status and available source-integrity records are immutable under ../../../../evidence/cycle-algebra-failed-01/. The subsequent native full33/70a16a,formal03/nine bound statements and algebra02/8d3d02 are separate records. A later pass never substitutes for this failure. [pcc:unverified]

Sources checked:the frozen protocol,exact source and full diagnostic. KB MCP/ wrapper and encrypted atlas are unavailable. The parent report/proof carries primary literature and characteristic hypotheses. No new cryptographic engine, paid execution,solver,relaxed criterion or independent signature is introduced. Read ../../REPORT.md and ../../report.pdf for the result and complete evidence map. Upstream diagrams stay current at their original mathematical scope; this diagram covers only the failed execution boundary. [pcc:unverified]
