Ordinary binary n47 m4 dataset pilot

All four frozen native cells have terminal restricted S3 custody. Both geometric F6 cells and untwisted bounded enumeration were native verified; twisted enumeration reached the preregistered 30-second native timeout with a verified transition artifact. No cell promoted an independently recovered ECDLP scalar.

Exact outcomes

Method	Untwisted	Twisted
F6 geometric four-sum	verified	verified
Bounded enumeration	verified	timeout

Evidence and measurement scope

The independent audit rehashed four archives and 128 native artifacts and checked paired public inputs, curve/twist identities, point-count certificate types, and full coefficient-field degree 47. The pinned official export checker reported zero findings: four planned and attempted, three completed, one timeout, zero exclusions. Producer S3 receipts cover every archive and pointer; separate fresh reads sampled indices 0 and 3. Archive bytes total 1,015,585.

Sixteen phase telemetry records retain raw calling-thread readings, but zero whole-worker instruction labels are eligible for training. The timed-out enumeration record is censored; F6 private lookup events are not exported. See `report/run.md` for hashes, commands, and linked evidence.
