Recovered polynomial proof gate v2

Gate lean-gate-v2 was launched at 2026-10-24 01:21 UTC against the original combined OrbitCoordinates.lean module. Its standalone-file path corrected the earlier v6 directory-path error. No final gate receipt survived app recovery.

Reconciliation found no surviving compiler or launcher. The temporary build directory survived and its log records failure to create a Lean worker thread. The log is retained as runs/lean-gate-v2/recovered-build.log. The original stdout/stderr and reconciliation note remain intact.

No theorem or axiom audit passed in this attempt. A fresh bounded one-worker run follows; it is not counted as a second successful proof. No comparable performance values exist, so the visual is a process diagram.
