Ordinary Kummer fiber: reviewed conditional derivation

Shared $S=b1^2$ → at most two candidates, differing by simultaneous negation

S=0 requires R1=0 for validity; repeated support does not alter polynomial reduction

Neighbor fiber property + $2G\neq0$ → at most one distinct signed match

Existence still needs candidate completeness, chart identity and successful projections

11 producer + 7 reviewer fixed assertions; written universal argument, not Lean proof

Matrix-square arithmetic is separate from a geometric two-torsion translation law
