Fused companion validation: launch observation

2026-11-01T22:52:05.867104+00:00 · Live process snapshot; not a terminal report

The single frozen invocation is running with its original 3600-second cap. Producer PID 2245648 and follower PID 2245741 were verified against their process start ticks at this observation. The follower never launches trials; it runs analysis and export checking only after producer exit zero. No restart occurred.

Complete context receipts at snapshot: 18 / 1698

Live run; full acceptance and A/A remain pending.

Completed prefix. 18 context rows, 2250 product calls, 9000 rejected output/count/trace/sign mutations, 6750 equal-wrap rejections and 0 radix-guard rejections. These counts describe only complete rows at this timestamp. Later contexts, carry cohort and A/A are not inferred from this prefix.

Construction under test. Deferred-reduction companion application retains positive packed coefficients through convolution, extraction, wrap, sum and inverse scaling, decoding and reducing the final n coefficients. The radix bound, every carry-fixture intermediate, archived outputs and independent native bit-volume accounting are checked under the frozen contract.

Full declared cohort. All369 archived contexts per arm, plus480 carry contexts per arm: 1698 context rows and34248 product calls. Every archived full, inverse and principal-block product is consumed exactly once per arm. The archive supplies a dense-verified correctness baseline; no timing comparison is made. Field counts, native arithmetic/bit volumes and bytes remain separate.

Predata evidence. Commit3e77b2c; protocol hash 21e18b0471cccf698b0ffc2f82e02fe3e393f86004813af3d41a145aa1a0c843. The schedule preflight matched all1698cells before data. Ten source files and two public archives are hash-locked. Source and analyzer were committed before the first trial. The primitive actual-overflow certificate is separate from rejecting a radix that lacks the proof bound.

Custody. Producer session 13479; follower session 28565. Native timeout deadline epoch 1793576987.8451536. Follow these handles; never rearm the timeout. The original capped Schur panel remains unchanged. No external jobs changed.

Snapshot integrity. 112503540 complete-prefix bytes, SHA256 2234b227ee779199f64b3dcf614f642b2882136128a7dd6f8c81603c9a0c4c37. snapshot.json retains exact fields. Raw output is mutable while the producer runs and is not sealed by this launch report. Final rendering is prepared but requires successful producer, analyzer, export and follower terminal receipts. Freeze and launch records remain independent of any later result.
