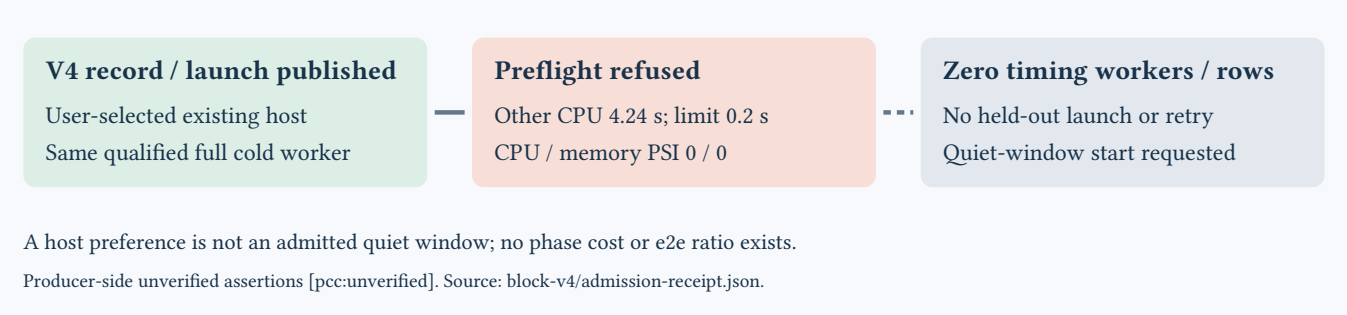
# Existing-host quiet-window amendment

CM-BLOCK-COLD-V3 family · protocol version4 · PR 3674
P-192 primary; P-224/P-256/P-384/P-521 retained

## Recorded admission outcome

After the user selected a quiet window on this existing host, one new bounded calibration opportunity was frozen/published. The unchanged qualified worker, original scalar/points, full cost boundary, references and thresholds were retained. The former V3 refusal and offline tuning data were not rerun or substituted. [pcc:unverified]



The calibration launcher returned 3 before the timing worker: measured other CPU 4.24 seconds over the two-second preflight exceeds 0.2; CPU/memory PSI avg10 are 0. There are no point-action times, phase costs, A/A values, worker RSS or e2e ratios. No held-out launch or retry occurred. No other session/process was stopped. The next user question requests a start time/readiness for the quiet window. [pcc:unverified]

## Preserved full-cost test

The existing implementation begins its cold clock before dispatch/object initialization/request parsing. It charges fresh curve/point setup, quotient/remainder and recoding, bank-label construction, DP allocation/transitions/reconstruction, point-bank construction/normalization, execution, symmetric output verification and required destruction. Five exclusive phases sum to total; nested bank/loop costs partition arithmetic. A native receipt must admit the full SMT reservation 14,30 and show uncontended execution. No plan or point bank is reused between calls.

The unchanged planned matrix is 25 configurations, four calibration and eight held-out points per curve, one warmup and six rounds (3500/7000 rows). Every output is original $[\mu]P$. Per curve the deterministic block primary must beat the fastest of eleven reproduced regular/binary reference medians at every held-out point beyond max(1.01, the paired A/A envelope). The criterion remains untested in this refused opportunity. [pcc:unverified]

## Publication, resources and custody

Frozen record/launch 3d22ec698fe0 was hosted and PR updated before the attempt. Protocol body digest 909d66a15190fd989d183f6d29866c0152bb6c3e7498a8fb6fecddc98f566d72. The worker/analyzer/isolation and ten runtime source/nine input bindings remain unchanged; context was refreshed. One 120-second/2 GiB/thread 1 attempt per panel, no unchanged retry. No cloud job, cap/role/budget or generator/controller change. [pcc:unverified]

The 1240-byte raw archive, SHA256 6273aeec44467a099554bfd0ea44bbbc0c54d89c6006720cf9693f84da013751, retains exact launch, empty stdout/stderr, exit, refusal and stopping bytes. Fresh extraction verifies member hashes and receipt bytes; deterministic repacking matches. The export validates its schema. Raw records were pushed before this report. These local checks and all observations are producer-side unverified assertions pending signed independent PCC standing. [pcc:unverified]

Evidence: ../../block-v4/README.md, admission-receipt.json, summary.json, export.json, runs-manifest.sha256 and runs.tar.xz.sha256; ../../protocol/block-cold-v4/. Existing native qualifications/source are linked from the prior V3 report. No source/test rerun was needed for this environment-only amendment. No Rust implementation changed; no local root Cargo result is claimed.
