Local runtime route reconciliation

Local Docker route · read-only observations

Existing sudo -n route: available

Server25.0.16 · exit0 · no stderr

Exact upstream image pin: not found

Image inspect exit1 · no pull attempted

Final image bindings remain null. No container, build or cloud action.

Observed 2026-10-31T02:12:43.347165+00:00. The existing noninteractive sudo -n docker route can reach the explicit local unix:///var/run/docker.sock endpoint. The version command exited0 with empty stderr and reported Docker server25.0.16. This resolves the prior direct-user socket readiness gap for this specifically authorized read-only route.

Inspection of the exact pinned upstream reference public.ecr.aws/aws-cli/aws-cli@sha256:b94fc7612d131f1a3cb76145ba3385c813ad7561ef2c2b60c89fbd5dfee93d39 exited1 with the daemon error No such image. The named immutable reference is unavailable locally. No global image list or unrelated metadata was inspected; no claim about other tags or images is made.

Only two read-only Docker commands ran, each under a20second subprocess bound. Endpoint/context/TLS selectors were cleared from the subprocess environment if present; none were present. The endpoint was explicit. No credential files, image environment values or global inventory were printed. No daemon change, group modification, image pull/build/push, container action or cloud command occurred.

The readiness and qualification-draft manifests plus Dockerfile.ecbench are hash-bound in source-bindings.json. The upstream pin is not a final ecbench image identity. Final ecbench/runtime image IDs remain null. This inspection supplies local route and named-image observations only; it admits neither image assembly nor software qualification/scientific execution.

The managed cloud environment-status tool was unavailable in the exposed tool catalog. No network operation was attempted. Follow-on image preparation, if separately admitted, must retain the existing source/binary/runtime bindings and qualification protocol; this read-only result does not expand privileges or execution scope.
