R99: degree-112 marked-23 lambda resultant norm

Koblitz modular IC research

3 November 2026

The frozen source-bound Singular attempt computed $\mathrm{Res}_y(f_{51}, \mathrm{Res}_l(G_{51}, \partial_l G_{51}))$ for the accepted R51/R63 degree-112 triangular source. Both resultants are nonzero. The final rational norm has numerator degree 1968, 74 nonzero terms, and denominator x^{2608}. Every numerator exponent is divisible by 16, suggesting a degree-123 Frobenius root to factor next.

The native run exited zero, printed its exact pass marker, and contained no Singular error lines. A separate fresh Singular process reproduced the exact output byte-for-byte. The immutable raw archive contains both runs and has SHA-256 `7cebf6664d1442401cc8ba40cde0df109fd29a24c663af6d67b0b5e9cb72caa7`.

This calculation gives the lambda derivative norm of the displayed monogenic order on $D(x)$. Factorization of the degree-123 candidate root, then local normalization at the combined finite supports and infinity, are the next steps. No normalized ramification index is inferred here.
