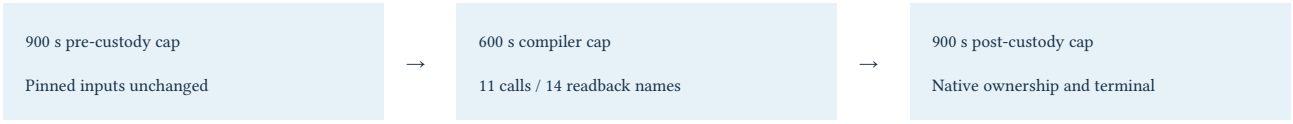
Find-root cardinality replay renewal

Source-only operational successor; T-2125. No compiler or replay invoked.



Source-only renewal; final release and ledger values remain absent.

Exact preserved proof scope

Eleven compiler calls and fourteen readback names are unchanged. All mathematical source modules, controls, source origins, import amendments, module closure and runtime pins retain their predecessor digests. The False negative control and standard axiom checks retain their original semantics. This packet introduces no theorem or proof change.

Operational bindings

The source supplies fresh workspace and phase-unit identities, current boot, the 129600-second campaign ceiling and deadline 2026-11-11 at 12:00 UTC. Prior debit and remaining allowance remain null pending final serial ledger reconciliation. The historical materializer debit retains the original 900-second bound and requires its authenticated receipt. Release remains false; publication, independent review, ledger and live ownership bindings are pending. The total attempt cap remains 2400 seconds: 900 pre-custody, 600 compiler and 900 post-custody. Resource limits, single attempt, zero automatic retries, native ownership, cleanup and terminal checks are unchanged. Shared-cache trust limitations remain the original ones.

Evidence and next review

The source patch, frozen input hashes and exact predecessor-review bindings are retained. No runtime result, kernel readback or cost ratio is reported for this successor. Independent source and final operational binding reviews precede any execution.
