Synthetic planning observations — unadmitted timing

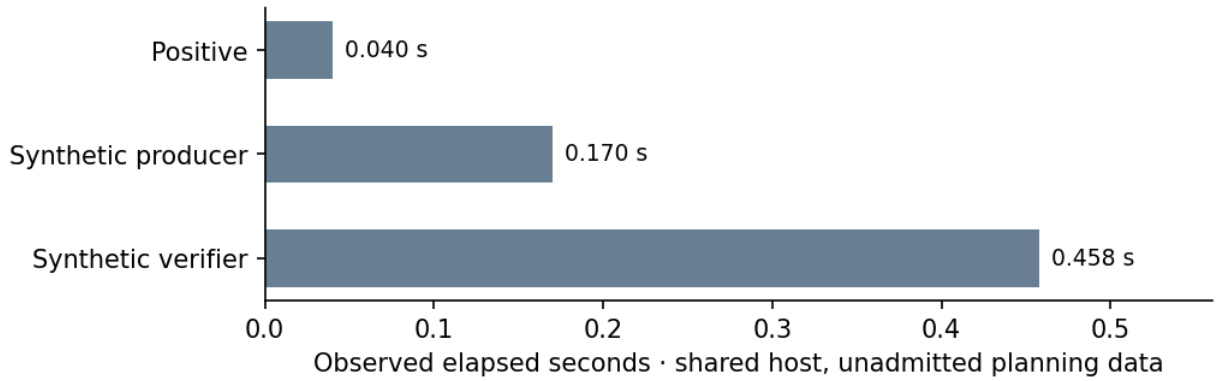

29 October 2026. The canonical freeze refused a null runtime estimate. After a successful uploaded checkpoint, one synthetic planning invocation ran three sequential phases on an AMD EPYC 9V74/Linux 6.18.55 shared local host. This was not a timed NIST-cohort run or an admitted performance benchmark. There was no quiet-core/reservation evidence, A/A spread or matched external reference.

Recorded elapsed observations: positive 0.040 seconds, synthetic producer 0.170 seconds and synthetic verifier 0.458 seconds. There is one observation per phase, resolution 0.001 seconds; no spread or confidence interval was measured. Flow: three phases planned, attempted and completed, statuses 0; zero failures, interruptions, resumes or exclusions. These different tasks are not competing implementations of the same computation, so no speedup or fastest-tool claim is calculated.

The fixture repeats six tiny fields into 21 parser rows, with dummy 1,127 inherited features and planted G=[b]Q equalities. No actual cohort was read. The planning model 0.040 + 512*(0.170+0.458) = 321.576 seconds is a heuristic allowance, not a measured cryptographic-size runtime, statistical estimate or mathematical upper bound. Actual phase limits remained 30/300/300 seconds. Only this synthetic planning record has elapsed values; no performance clock is admitted for actual attempts 001/002.

Source: literal observations and model, runs/synthetic-preflight/ in the full raw bundle and the separate 230,404-byte evidence/preflight/preflight-001.tar.xz, SHA-256 806b24e1ec5cdbaf502e54e3319939ef0c195bf1d641232ca9b33524965e2f5f. The canonical freeze refusal remains in the protocol evidence.

Browsing copies of this report/PDF, graph SVG and 150-dpi PNG are regenerated under benchmarks/20261029-generator-preflight/. They remain outside the admitted benchmark table: there is no independent timing replay, matched rho reference or VALIDATION.json. This follows the admission gate rather than fabricating evidence to create an admitted row. The benchmark index links the documentary record in prose.

Synthetic preflight 001 · n = 1 / phase · resolution 0.001 s · no measured spread or NIST timing
