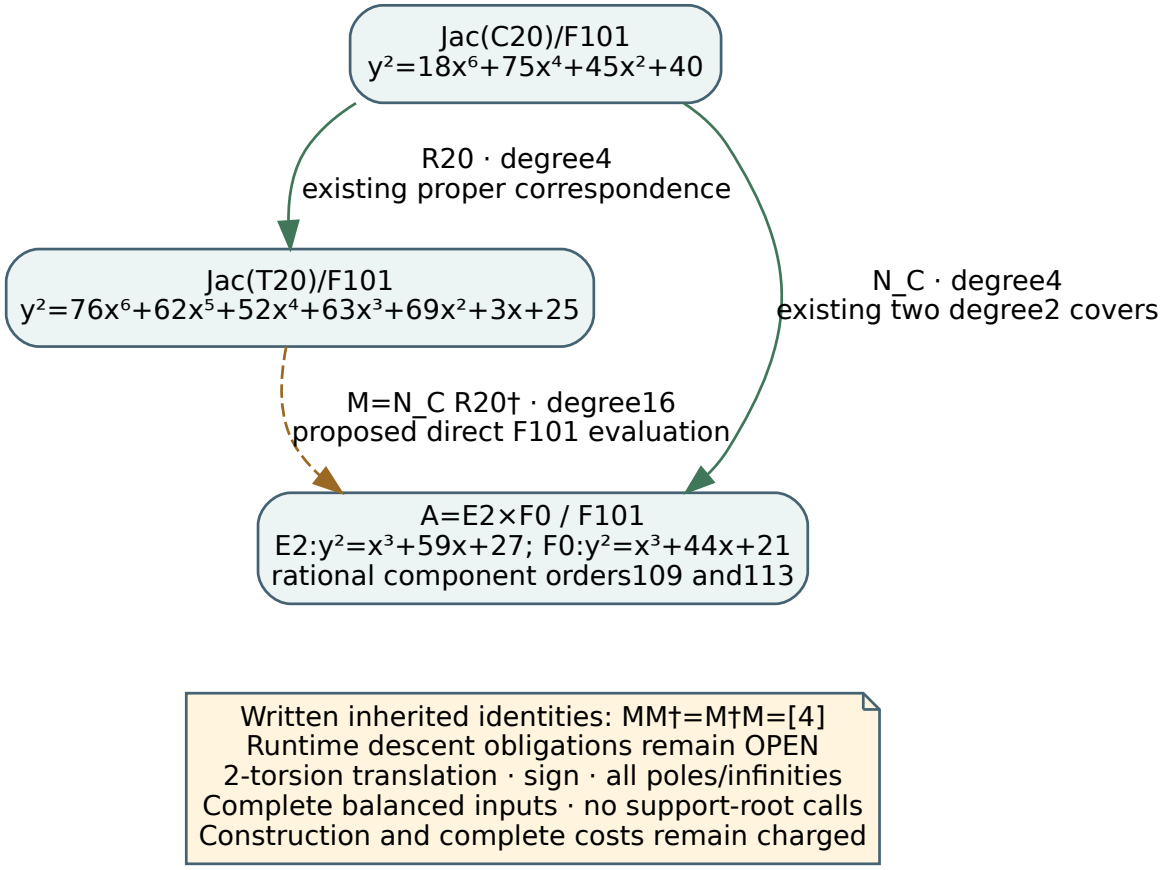
T20 direct elliptic norms: next component

2026-11-12 · primary-reviewed planning02979e · unsigned

The proper maps now have complete local consumer replay400f38 and ready PR1517 at8072. Next derive a direct evaluator of M=N_C R20† on raw T20 balanced Mumford inputs using onlyF101 arithmetic at runtime. Existing Picard/polarization identities imply MM†=M†M=[4] and degree16 as written deductions;these are not new executable acceptance. [pcc:unverified]



Solid edges are existing constructions;the dashed edge is the proposed direct evaluation. No timings,measured advantage or new acceptance data are shown. The degree16 is the Jacobian norm degree;its two optimal elliptic covers have degree4. [pcc:unverified]

Derive the reverse quadratic fibre,its elliptic sums,positive-adjoint sign and two-torsion translation descent. Require every normalized coefficient inF101,cleared curve equations,all12317 balanced classes,and complete branches/poles/signed infinities/repeated jets. Preserve raw leading76 through a square coordinate normalization. The final evaluator must use no input-support roots. Setup may reuse and must charge the existing extension-field construction. Freeze the new protocol before code. [pcc:unverified]

The six-cycle target has only its opposite invariant matching. CT50′s bidual identities and BD§8′s(id,−id) mirror automorphism constrain that branch. A coherent cover translation preserves its degree-zero norm; controls must respect this invariance. No novelty inference is made. [pcc:unverified]
