Blind spot 08: learned branching for WDSat / XOR-CDCL on Semaev CNFs

Verdict: BLOCKED (level: constant). The frozen primary test (cards 05-10, n = 31..37) did not run: cards 05-09 were refused at lint because `raw/model.txt` is not pinned in `binds`; card 10's `summarize` found no `test-n31.jsonl`. No performance claim; no gap-to-rho row.

Measured: card 01 replica equals stock WDSat on 60/60 decision counts, 60/60 verdicts, 30/30 certificates. Cards 02-04 produced training samples (n = 23, 25, 27, 29) and `model.txt`.

Exploratory validation (card 04, 16 instances, n = 23..29, one seed, no intervals, native work unpriced): mean log2 cost identity 20.296, b_lin 19.847, b_gbt 20.363, b2_lin 20.564, b2_gbt 20.618. Root oracle gain over incumbent first variable 1.0036x. Descriptive only; not the frozen test.

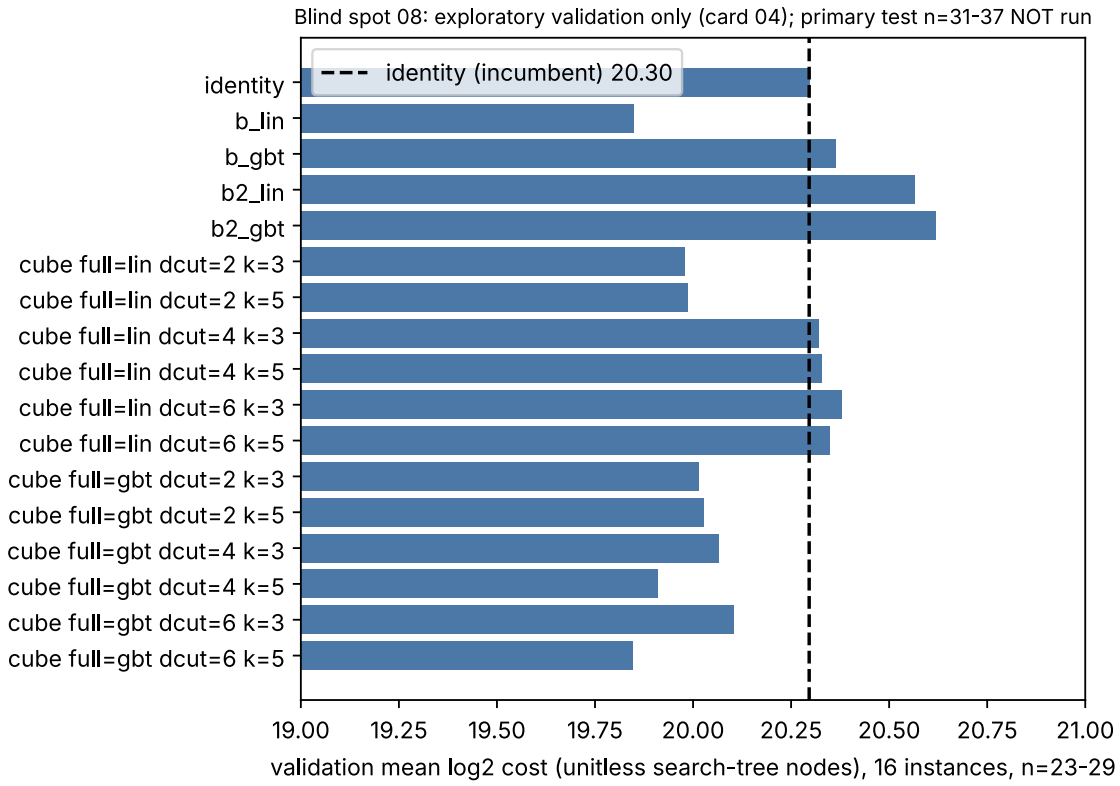

Figure: recorded validation mean log2 cost per arm (raw/fit.txt, card CARD-BLINDSPOT-08-04).

Caveats: host L0, toy scale, controls (bs, b2s, d, a2) and CMS arm not run. Fix: re-freeze cards 04-10 with model.txt (sha256 00f0d29d…0809) pinned, then re-dispatch.
