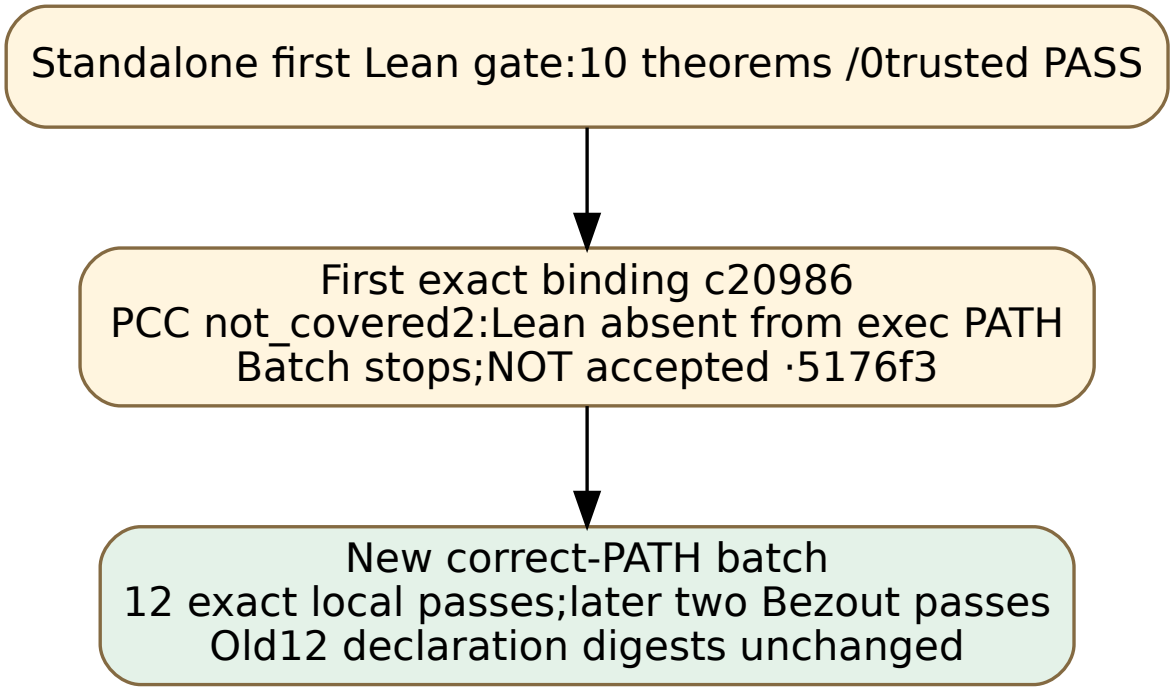
Direct norms: preserved binding failure

2026-11-12 · original5176f3 /c20986 · unsigned

The first exact proof-binding batch is NOT accepted. Its standalone 10-theorem/0trusted gate passes,but PCC returns not_covered2 because Lean is absent from that exec’s PATH. The script stops after the first claim;it never records a local verifier pass. [pcc:unverified]



Full original source,partial claim,verdict/error and gate outputs remain immutable. A correct-PATH batch separately binds12 declarations,and two later degree witnesses pass with all twelve prior declaration digests unchanged. Distinct complete40-module gates retain both236compiled/210 written and final238compiled/212written,all0trusted. [pcc:unverified]

Candidate01/4771dd and final02/9214e7 keep the same universal identity ID IDC1h6de045a64b58c1c8. Only the ProofRef payload/source fingerprint changes after proof strengthening;all ten earlier certificate payloads remain byte-identical. Both candidates stay. Fixed$2^{61}-1$ certificate checking does not establish the actual characteristic101 curve equations. [pcc:unverified]

Native full43/85436f is separate acceptance. Wrong global sign differs 12316 times and agrees once;each cover has238 applicable missing-infinity mutant mismatches;all six malformed inputs reject. Coherent translation is a positive norm-invariance control. The missing-PATH failure is an environment/binding gap,not a mathematical counterexample. [pcc:unverified]

REPORT.md links original failure evidence,new exact bindings,degree bindings and the complete result report. The diagram has no comparable timing data;prior scientific/IC graphs remain unchanged. These are local correctness/proof observations,no cost result or scientific signature. [pcc:unverified]

Prepin PDF attempt01 also failed on a literal multiplication mark parsed as Typst markup. Original draft sources and diagnostic stay in the linked evidence. The literal-markup correction changes no math or recorded value;final pages require inspection after rerender. [pcc:unverified]
