p=13 twist-quotient pair-table oracle

Run ID: `run-20261022T0644Z-quartic-pair-quotient`. Intel Xeon 6975P-C, 32 logical CPUs; shared-host L0. On the same seven recorded residuals, the full and quotient tables returned identical complete signed decomposition sets. The full table has 5,112 entries; the quotient stores 426 orbit representatives and 350 canonical keys. Every pair-entry orbit has size 12. A/A non-timing diff is empty.

phase	F_p multiplications	group operations
full setup	495,864	5,112
quotient setup	544,746	426
full seven queries	7,029,782	72,576
quotient seven queries	96,036,422	72,576

This is a storage/work-size and operation-count result. Hash probes, allocated bytes and calibrated whole-method costs were not measured. Raw data, command and source hash are in `README.md`.
