Actual bounded node differences
alpha/(m-j) is even in the actual integral ring
Actual polynomial reductions modulo2
D -> rho_m; R -> rho_m inverse
Actual even remainders
Unit evaluation at every substitution when2 is nilpotent
Constructed finite entry comparison
One actual common unit; divisibility thresholds equal
Still required: actual recursive mode and entry evaluator
Uniform enumeration, precision and bit-arithmetic costs
Still required: prime-field reduction tied to input bits n
Complete exp(o(n)) bound or applicable universal lower bound
