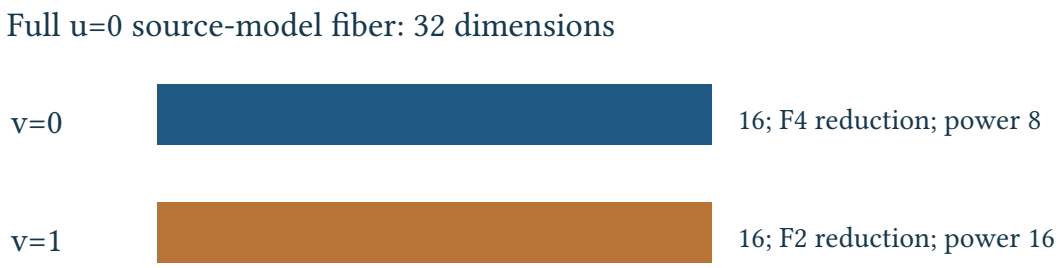
R78: complete degree-32 source-model fiber at u=0

R77′s $z = \infty$ is R50′s finite-u chart at $u = 0$: the overlap gives $U = u^2V = v$. The accepted full-source specialization is $F(\lambda, v, 0) = \lambda^{16} + (v + 1)\lambda^8 + v + 1$. The two quadratic components are $(\lambda^2 + \lambda + 1)^8$ at $v = 0$ and λ^{16} at $v = 1$.



The full model fiber has dimension 32, split 16+16; its reductions have degrees two and one. One native run passed the exact identity, dimension and wrong-factor gates. Three pinned Lean chart, eighth-power and arithmetic theorems compiled and passed the axiom audit with zero failing and zero trusted. Eleven source-byte pins and six donor hashes match.

The repeated powers are local lengths in the R50 source model. Normalization at $u = 0$ is the next computation before assigning individual degree-32 branch residue degrees, ramification indices or coordinate orders.
