Mixed-dispatch and nonsingularity component snapshot
2026-10-31T03:04:14.746381+00:00

Mixed dispatcher / field - reviewed
Original point/divisor polynomial validity and four nonzero weights over a field imply a valid nonzero-weight Some payload in every degree1+2 branch; explicit and nested None branches excluded.

Mixed dispatcher / UInt64 - reviewed
Prime 5<=p<2^31, canonical inputs/curve coefficients, n=1 and tables=None, four nonzero weights and original normalized validity imply canonical valid payload in literal source order.

Repeated-support tripling / field - reviewed
Original mixed-input validity and the repeated positive-support guards establish nonzero output weights and polynomial validity for the literal tripling payload.

Repeated-support tripling / UInt64 - reviewed
Canonical input and prime bounds as above; raw constants 5,8,10 handled by explicit no-overflow/reduction correspondence, including p=5 and p=7. Scoped Some and validity composition.

Degree2 equal-arm guard exclusion - reviewed
Over a field with 2!=0, crossed ordinate equality and earlier inverse guard false exclude the nested b=0,s=0 identity arm. Does not exclude direct-call identity or prove doubling output validity.

Same-u extracted point - reviewed
Original two Mumford divisibilities, noninverse and nonzero slope difference give a valid extracted point. Four nonzero weights connect the exact field expression to normalized coordinates. Singular zero-ordinate example retained.

Local nonsingularity bridge - reviewed
Zero extracted ordinate forces a square factor and simultaneous value/derivative zero. Explicit local exclusion gives ordinate nonzero; with 2!=0 and four nonzero weights, subsequent doubling yields valid nonzero-weight output.

Global coprimality bridge - reviewed
IsCoprime f f.derivative supplies Bezout exclusion at every x, then the local premise and nonzero extracted ordinate. Arbitrary field; characteristic-five controls pass; not a geometric characteristic-two smoothness assertion.

Software evidence
full library: 5793 passed; 0 failed; 128 ignored
affected GPU tests: 8 passed; 0 failed; 0 ignored
maintained Clippy: pending_no_terminal_receipt
final-source CLI build: pending_no_terminal_receipt
Retained b985 binary: reviewed static candidate; final-source build qualification remains separate.

Formal results prove expression values and polynomial validity at their stated branch scope, not class sums, compiler execution, counter preservation or complete degree2+2 dispatch.

Producer and reviewer failed proof/import/numeral/timeout attempts remain in linked packets. Earlier GPU lock failures remain retained; later passing software receipts do not establish their source-level cause.

Reviewers disclose authorship of imported components. Kernel readback is accompanied by scoped source review; cached dependency objects were not all rebuilt.

All new full-cohort cost ratios are null; no scientific cohort was run for this snapshot. Existing scientific campaign limits are unchanged.
