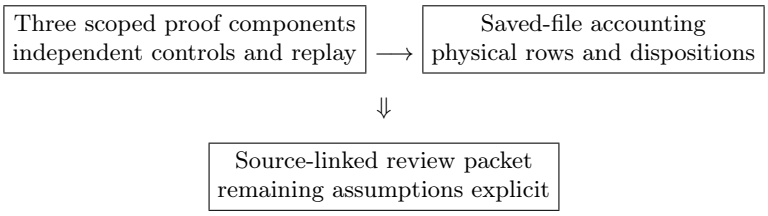
Collector composition: proof and accounting results

Three parallel proof components and a read-only saved-file accounting check are archived together. Each component retains its own assumptions, controls, failed attempts, source bindings and independent review. No scientific run or timing measurement occurred.



Signed graph algebra: nine main declarations and nine producer controls passed. Independent replay added six controls and read back twenty-four declarations. The formulas cover potential compression, edge reduction, both union orientations and fixed-child transport. Native forest invariants, mutation policy, cycle handling and modular-word headroom remain separate obligations.

C-zero interpolation: nine main declarations and six producer controls passed. Independent replay added six declarations and read back twenty-one declarations. Literal A, B, C identities give a common interpolant when B is nonzero and C is zero. An explicit Bezout identity establishes coprime supports; their product divides f-l squared under both input residual-divisibility premises. Weighted scale transport, output curve membership and divisor-class semantics remain to connect.

Kummer signed pairs: three main declarations and three producer controls passed. Independent replay added eight controls and read back fourteen declarations. Exact sign-quotient fibers and a non-two-torsion anchor imply uniqueness from both adjacent projections. Concrete projection fibers, nonzero vectors, special doubling and exceptional-candidate existence remain geometric obligations.

Saved accounting: 180 physical archive rows remain represented, 60 selected and 120 unselected. 420 indexed dispositions reconcile as 218 ineligible and 202 compared; the compared partition contains 174 first and 28 redundant observations. Setup metadata agree within each physical row, and once-per-row totals match saved analysis. Four altered-copy controls fail closed. Root rebuilt the checker separately and obtained byte-identical output. These are historical ledger counts, not new target completions or natural-yield estimates.

Accounting provenance limits: the index is checked by row/case identity, absent observed identity fields are skipped, and receipt-to-archive authentication is not established. These limits are recorded additively. Complete cost ratios and natural yield remain null. The full 1,260-target requirement and expired 2026-10-31 06:00 UTC campaign deadline remain unchanged.

All three independent reviews are scoped technical checks; full formal-review workflow and compiled Rust equivalence are not claimed. Publication task T-1216 succeeds T-1215 because Conductor lease handback changed T-1215 to cancelled and disallowed reopening; no work or budget was restarted. The shared session-log append still awaits the previously requested reservation exception.
