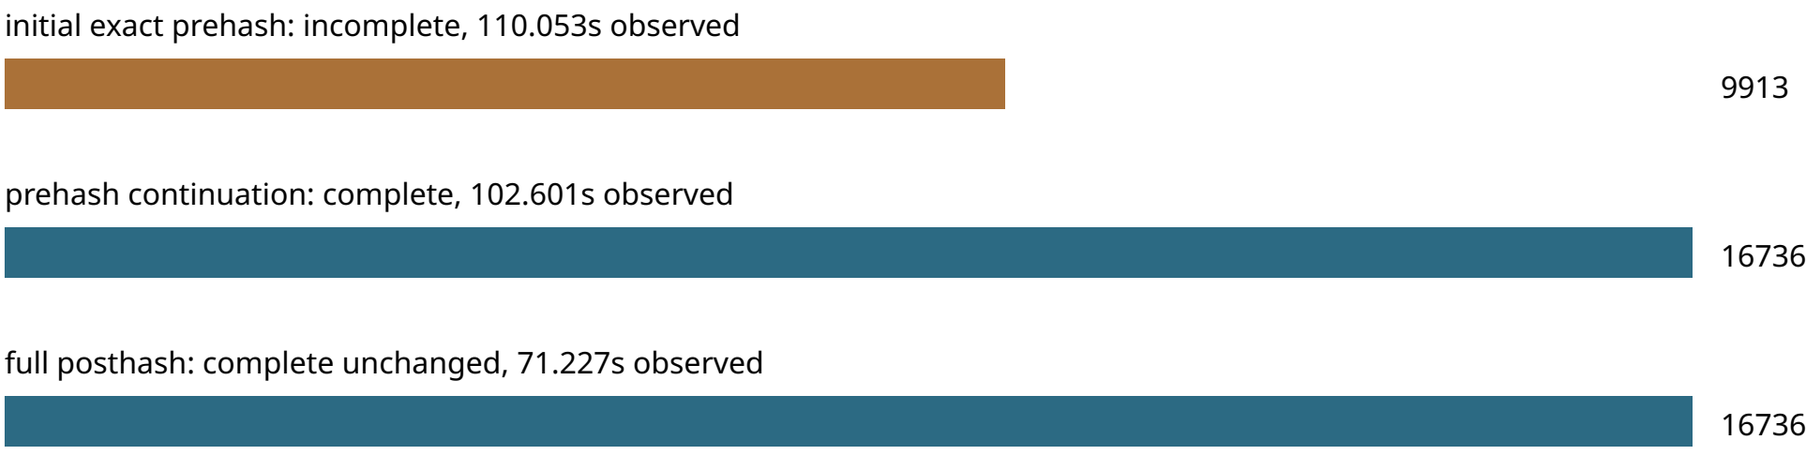
Actual-quintic nonbranch norm-order construction

T1538 | source construction and software-validation custody | 2026-11-03

Constructed: concrete affine-to-projective stalk map, scalar units, numerator nonunit,
source norm identity and its proposed local valuation composition (9 declarations).
Proposed assumptions: separable actual quintic; char !=2; y0 !=0; b !=0;
valid input divisibilities; explicit branch selection n(x0)=b*y0.
Validation: first Nonbranch invocation reached its cutoff without diagnostics/olean.
Cleanup wait also timed out. Native receipt absent; later process absence observed.
Launcher exit0 means sequence finished: compiler exit1, posthash exit0.
No theorem acceptance or causal explanation of timeout is inferred.
Bound closure: 16,736 files / 3,111,892,318bytes; full posthash equals premanifest.
Inherited cache/source correspondence remains trusted; no transient-change exclusion.

Recorded custody phases: cumulative bound files (one observation per phase)



Initial prehash failure and earlier resolver/parser diagnostics are retained.
Continuation added6,823files; bytes of prior9,913files were not rehashed until full posthash.
Evidence: custody*.json; compiler-phase2-failure-observation.json; raw archive manifest.
Source proof remains uncompiled. Next: same9 declarations +4controls +13readbacks.
Prospective phase3:900s maximum (300prehash +300compiler +300posthash), unreleased.
No scientific trajectories were run; graph reports custody records, not performance.
