APS single-relation correctness instrument · 2026-10-26
Solid path: implemented on tiny public fixtures · Performance panel: pending
Public (E,G,Q,n)
Target logarithm excluded from solver arguments
Known labels R = uG + vQ
Random or fixed coefficients · validated signs and orders
Distinct coordinate base
Random lists or verified automorphism orbits
tests only
Equation choices
Partitioned S3 · cubic divisor · two-pair blocks
Expanded S4 · joined S3 · hybrid · covering family
Unit-test oracle
Exhaustive point addition; separate from polynomial solving
Existing native F4 + substitution
Shared branch budgets · explicit incomplete status
compare full coordinate sets
Decode roots and signs · check point sum
AG + BQ = O · reject B = 0 · verify (-A/B)G = Q
correctness does not establish speed
Pending performance validation
Complete accounting + replay + frozen protocol
S3 checkpoint + matched controls/rho + external solver
