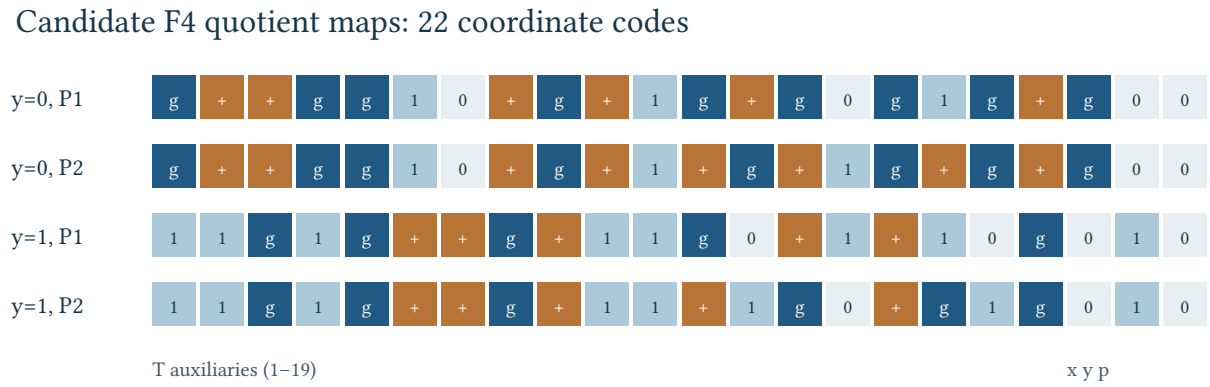
R81: four explicit candidate F4 maps

For each R80 prime quotient, the native program chose a generator g with $g^2 + g + 1 = 0$, printed all 22 variable images in $\{0, 1, g, g+1\}$, and verified the resulting map ideal equals the prime ideal in both directions.



The source coordinate triple (x, y, p) is the same for both primes over each component: $(g, 0, 0)$ at $y = 0$ and $(0, 1, 0)$ at $y = 1$. Five auxiliary coordinates distinguish the first pair; six distinguish the second. These are exact maps of the rejected R50 candidate algebra. Source-field equality and local normality must be checked before the split is used as branch geometry.
