Catalog metadata validation - 2026-11-05

Engineering run record; unverified producer observations

This run refreshes generated cover metadata after a source-backed registry import. It does not rerun or promote historical benchmark measurements, establish storage custody, or claim DLP advantage.

Actual check	Observed result
Historical native cover byte replay	20,848 records; exit 0
Canonical native regeneration and byte replay	22,766 records; both exit 0
Old cover and graph records retained exactly	20,848 curves; 20,846 covers; 20,848 maps
Added source-backed cover/graph records	1,918
Complete benchmark target record equality	1 unique record; unchanged
Other benchmark input pins	211 verified; unchanged
Inherited scientific fields	All unchanged
Catalog source-binding consistency	Exit 0

Source commit: 61abb767e2569d63b512e31dcafb7aeec32d66ba

Current registry SHA256: 6dcbd903602eca7a6973136e86bff1f1e3a595a0ffa3dedc6374d4f1ed0a5ef3

Native cover binary SHA256: dc0950789a13fc37a36a811a3a06c6cacbda2731efd10224023cc7d375326147

Build: full locked root Cargo binary; dev debug assertions retained, debug symbols omitted; 2 build jobs.

Exact commands, timings, input pins and output hashes are in the accompanying canonical record, inputs.json, logs and preservation.json.

Storage: not uploaded or remotely verified locally. Canonical CI upload/HEAD and every final-head gate remain required. No signatures or admission verdicts were issued.
