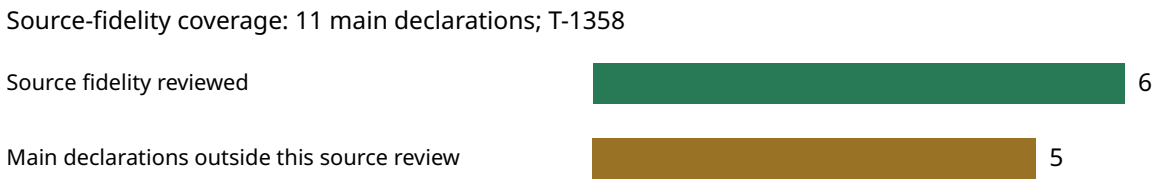
Branch counters: independent checks and remaining review scope



Subject 5342909fbc; source review T-1358; machine replay T-1359; archive T-1361. Fresh explicit Lean checks passed for all 11 main declarations and 8 controls. Separate source inspection found six main declarations faithful at their stated scope. The graph counts declarations, not experiments or performance; it has no sampling uncertainty.

Source findings. The native zero counter increments before the inconsistency assertion. Creating a new anchor does not increment it. Same-root cycle and negative-cycle placement and distinct-root two-anchor constraints agree with the model. Four independent strict bounds establish exact updates for the four named counters; other native arithmetic, storage and partial-failure behavior remains a separate obligation. No concrete mismatch was found in these assigned joints.

Fresh machine evidence. Five modules passed with 19 named axiom readbacks using only propext and Quot.sound. The false theorem failed as expected; empty, wrong-name and forbidden-axiom inventories were rejected. Each Lean call used 120 seconds, 4096 MiB and one thread. Exact source and input bindings stayed unchanged.

Dependency finding. The first private replay failed because the producer inventory omitted nested dependency files and Lean sidecars. The reviewer preserved that failure, completed the private snapshot and reran unchanged proofs successfully. The expanded snapshot contains 28,922 files; 28,637 expanded cache objects matched original bytes. Dependency binaries and compiler remain trusted: no independent binary rechecker or clean dependency rebuild occurred.

Review coverage. Five projection declarations still lack an independently assigned full state/return fidelity review. Neither reviewer claims blind re-derivation; prior adjacent work and actual reads are disclosed, and sibling reports were not read. The original plan was published prose. The structured independence checker returned exit 2 because it has no review_plan block. That limitation is preserved; this packet does not claim complete review or an official scientific transition.

Evidence and next construction. source-review/review.json and machine-review/review.json retain separate dimensions; summary.json joins them without changing either report. Exact scripts, sources, failed attempts and inventories are archived, with large inventories stored under the repository artifact policy. Complete projection fidelity and the component-owner/native-storage join remain next work. No scientific trial, cost measurement, cohort or execution limit changed.
