Actual F25 and E:y^2=x^3+1
Actual P,Q order3; S order2
All9 rational3torsion points proved
Compute both81-entry Miller tables
All used evaluations nonzero
Weil: omega^det; reducedTate: omega^(2det)
Actual domains A=E(F25)[3], B=E(F25)/3E(F25)
C=F25*/cubes; mu3=actual unit roots
|A|=|B|=9; |C|=|mu3|=3; final exponent8
F5 controls: Frobenius(a,b)=(a,-b)
Rational line has Weil value1 despite nonzero point
Base unit/cube quotient trivial: no leftND map
Root-valued Weil and raw/reduced Tate-class maps
Bilinear and nondegenerate in both inputs
Tangent substitution=(X-x)^3 proved
Canonical divisor/valuation identification remains open
