E14 (Amendment 19): RunPod run of the E13 parts that ran out of 13 GiB, 2026-11-09

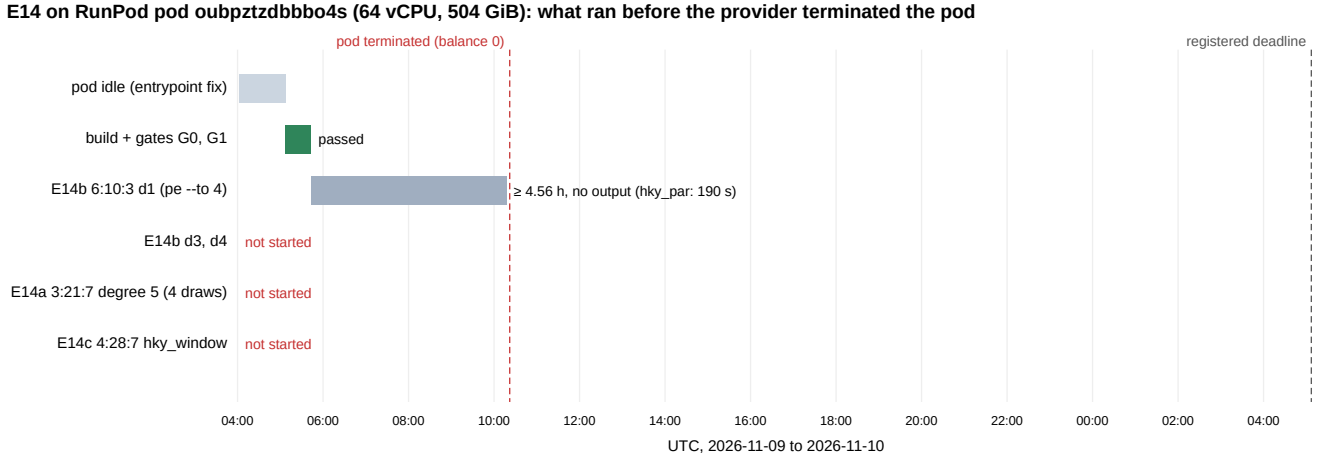
Not completed. RunPod terminated the pod, a 64-vCPU AMD EPYC 7702P with 504 GiB of memory, part-way through the first E14b draw. The pod's last upload landed at 10:17:27 UTC and the next 10-minute upload never arrived. At 13:07 UTC the API returned "pod not found" and the account balance was −0.04 USD. Termination for a zero balance is inferred from those two facts; no provider event log was read. Another pod on the same account (not part of this study) was billing 1.19 USD/h at the same time. Records: `e14/pod/` (last `out.tgz`, sha256 `0f8603c6…751965`) and `e14/score.json`. Report: `reports/run-20261109-e14/`.

Unit	Status	Registered reading	Prediction outcome
Gates G0 and G1	passed (G0 7/7 tests; G1 diff against `S3.d0.b4.jsonl` empty)	—	—
E14b 6:10:3 d1	ran ≥ 16,428 s (05:43:39 to 10:17:27 UTC) without output	**not completed**	"controls confirmed" (0.85) failed
E14b d3, d4	not started		
E14a 3:21:7, degree 5, draws 0/1/3/4	not started	**not completed**	"not completed" (0.15) occurred
E14c 4:28:7, hky_window	not started	**no reading**	"no reading" (0.75) occurred

The combined statement "independent agreement (E13b + E14b)" is not made. E13b's recorded reading stays "disagreement" (3 controls unmeasured; no measured draw differs).

Observation (not a registered reading). On draw d1 of 6:10:3 the reference hky_par closed at degree 4 in 190.4 s on 32 threads (E9). pe with `--to 4 --max-cols 600000` on 64 threads had not finished after 4.56 h. Locally, in E13, it exceeded 13 GiB after 2,343 s. So the pe degree-4 system for this 58-variable, 50-equation control costs at least two orders of magnitude more wall time than hky_par's. A rerun as registered would probably spend most of its window on the three controls. Before any rerun, measure pe's matrix size on d1 and decide whether E14a should run first. That is a design question for a new amendment, not a result.

Binary: `dreg_linear_guess` sha256 `f902edfd…321a99`, built on the pod from the frozen source archive `fd-src-a2be6609.tgz` (hash checked: OK). Cost: about 6.3 h × 2.56 USD/h ≈ 16 USD, including the idle first hour.



Readings: E14b **not completed** · E14a **not completed** · E14c **no reading**. Terminated between the 10:17 upload and the missing 10:27 upload.
