Actual source nodes
Exact level count 2^(a-i)
Actual slots and bit precision
q_i=h(u-i); p_i=p+8h*2^(a-i)+8M(a+1)
Exact prescribed total capacity B
Sum over actual nodes = sum over active levels
Odd level alone
B >= 8h^2*u*4^a
Source ceiling h*u >= 3M
u*B >= 72M^2*4^a
Scope: simultaneous fixed-width slots
Streaming/compression need separate accounting
