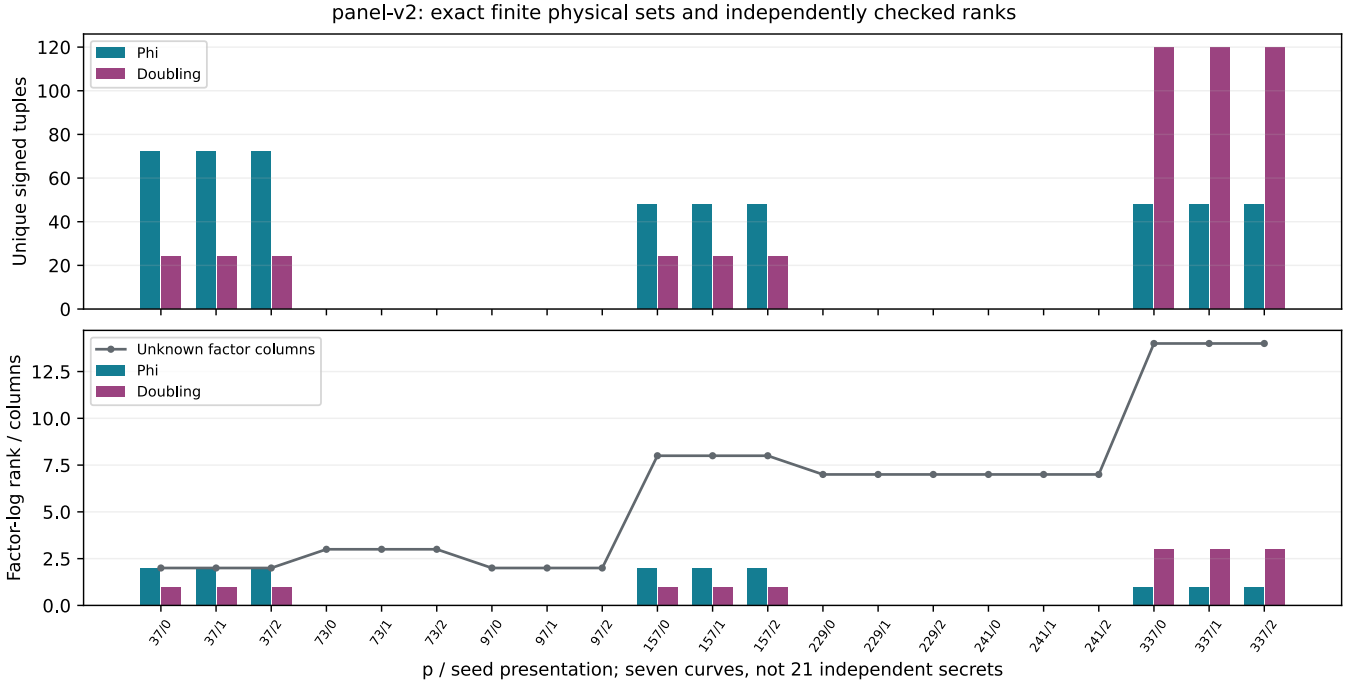
Complete zero-fiber polynomial panel

panel-v2 | start 2026-10-24T20:03:47Z | all 42 case-arms complete

The registered 42 case-arms and their independent audits complete successfully. Each mixed arm reproduces the immutable physical census. These are case-local count sums over seven curves in three public scalar-271 presentations, not independent secret samples or an amortized DLP price.

Arm	Signed tuples	Projective rows	Zero rows	S4 systems
Phi	504	15	0	33696
Doubling	504	15	0	33696



The audit independently constructs scalar-multiplication action maps and the signed-pair partition, checks each representative's physical relations and their transported union, reconciles recorded F4 work and uses separate RREF. Public binding, incomplete systems, missing system, duplicate pair, counter mutation and nonempty-set tuple/sign mutations are rejected. Field/curve arithmetic and the exact S4 equation deriver are shared; the full curve/group and field-embedding Lean bridges remain open.

All equations are zero-only and have zero target coefficient. No target recovery or complete IC cost is established. F4 counters cover row reduction only; other field/group counters and memory telemetry are retained separately. Shared-host elapsed diagnostics include durable journaling and are not admitted timing. Calibrated 0/0.1/1 GAE, strongest matched rho, complete external-solver pricing, independent secret sampling and scaling remain open.

One science worker; 8 GiB; 1,200 s outer watchdog / 1,180 s native deadline. Exact commands, source/runner/input hashes, journals, failures and independent references remain in the raw archive. No new admitted timing.
