Norm replay renewal source review

Task T-1959. Source review only; no compiler, tests or payload invoked.

Source findings

The renewal preserves all four Lean files and thirty names byte for byte, along with the original parser/negative controls. Every frozen source digest matches. The only replay source changes are workspace and deadline. Launcher changes bind the new host, campaign and unique unit names.

Both recovered custody manifest hashes match. Eleven runtime executable/library hashes match on the present host. The pinned boot and deadline agree with current host identity and November10 05:11:39 UTC. Full native dependency custody remains a separate pre/post phase. These read-only hashes do not replace that phase.

Conditional release

The source proposal is consistent but deliberately unreleased. Null ledger values fail before creating outputs or submitting payload. Exact integer accounting preserves 43,200 seconds and requires at least2,400 remaining. Current campaign charges must be reconciled after materializer termination. Historical5,400 seconds remain separate.

The coordinator authenticates publication, review, ledger, materializer-terminal and lease receipts. A SHA256 pin alone does not establish receipt provenance. Fresh lease/fence, absent unique units/workspaces, serial ownership and exact final command readback remain necessary. This review introduces no new user approval request.

Preserved controls

One CPU,8GiB,zero swap,128 tasks;900-second pre,600-second compiler,900-second post and2,400 total; no retries. Captured invocation and manager-journal terminal fallback remain unchanged. Compiler failure still requires post-custody when terminal ownership and budget permit. Later branch declarations remain outside the thirty-name scope.
