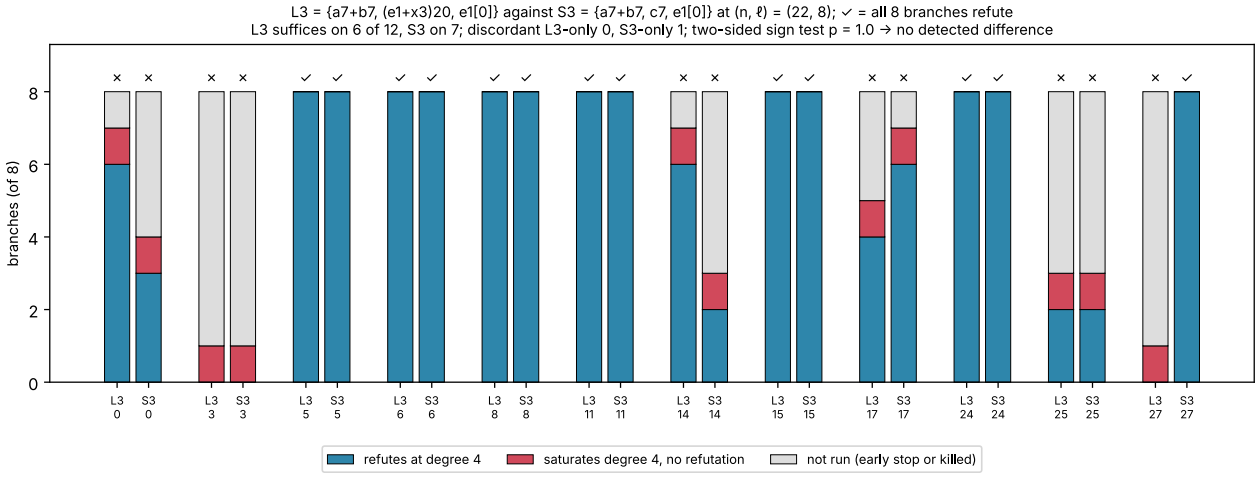
An invariant guess on the second link matches the raw guess on x_3

Study `research/dreg_second_link_guess_20261105/`, pre-registered. **Class:** stage diagnostic. **Registered verdict:** no detected difference. **Standing:** unverified assertion until a pcc verdict exists.

Question

S3 = {a_7+b_7, c_7, e_1[0]} is the best measured three-guess set at (22, 8) (2883). Does L3 = {a_7+b_7, (e_1+x_3)$_{20}$, e_1[0]}, which replaces the raw c_7 with a coordinate of the second link's swap invariant $e_1 + x_3$, suffice on more draws?

Result



- L3 suffices on 6 of 12 draws and S3 on 7 of 12.
- One discordant draw, which favours S3. The two-sided exact sign test gives p = 1.0, so the registered verdict is no detected difference.
- The two arms agree on 11 of 12 draws.
- Controls valid: the instrument identity, the identity and exactness checks, and every draw decided.

Reading

- In 2885, a second invariant guess on the first link was never better than c_7. An invariant guess on the second link is as good.
- One invariant guess per link does not lose at m = 3. It extends along the chain, so m = 4 is its test, and m = 4 needs a larger host.
- No row moves, and rho is not reached.
