Retained-image qualification: one failed attempt

T-1453, 3 November 2026, 19:33 UTC. Owner identifier: `4bf12f23-9aa5-42aa-8056-4fcfe21f116d`.

Observed result. The qualifier failed before running any test case because Python found no usable temporary directory in /tmp, /var/tmp, /usr/tmp or /. The qualifier recorded cleanup complete and qualification incomplete. The outer worker recorded command failure and the launcher exited 1. No automatic retry occurred.

Recorded quantity	Value
Outer wall time (seconds)	30.240972875
Service CPU time (seconds)	6.903
Qualifier elapsed time (seconds)	0.135876126
Test cases passed (count)	0
Conservative worker debit (seconds)	600
Remaining reserved campaign allowance (seconds)	23400

Inputs and limits. Exact source, bindings, review and launch command were published and independently read back at GitHub commit `f4fd538dde08e293aa6895c472f18d5349f7599e`. One attempt, 300 seconds, two CPUs, 2 GiB RAM, retained 4 GiB disk. Campaign deadline: 2026-11-04 06:00 UTC. USD1 qualification allocation; total reservations USD57. Actual dollar cost is not measured. Prior costs remain recorded.

Evidence and custody. See parent-directory publication.json, launch.json, completion.json, native-worker-result.json, native-receipt.json, journal.stdout and qualifier-receipt.stdout. Stopped unit, absent cgroup and empty associated loop inventory were observed. The qualifier receipt was extracted using read-only debugfs under a 30-second, 512 MiB limit. Disk metadata was unchanged by extraction; no content rehash was performed during extraction. The worker's new disk digest is retained separately from the historical assembly digest.

Scope and next step. This is a runtime qualification result, with no scientific target execution. Diagnose temporary-directory placement within the private mount namespace; any successor needs new exact source bindings and prospective review. The flow diagram uses the recorded stop point because there is only one attempt, not comparable trial data. Source: the 26-file native-result packet manifest.
