Software validation snapshot

Software validation snapshot

Typed retained inputs	3 passed / 0 failed
Full library run	5792 passed / 1 failed / 128 ignored
Isolated capsule replay	1 passed / 0 failed
Inherited-FD diagnostic	holds: EAGAIN; closed/reaped: acquired
Root follow-up checks	PENDING at snapshot

Mechanism observed; original failure cause unproved. Producer self-audit.

The full-library run retains one failure at GPU capsule lock reacquisition. The isolated replay does not replace that outcome. The deterministic pipe-barrier check observes errno 11 while an inherited descriptor remains open, followed by successful acquisition after child closure and reap. It does not identify the original failing interleaving.

Review boundary Producer self-audit only. Source/receipt hashes and barrier ordering were checked without another execution. No scientific observations or ratios are reported here. Root-owned reduced-concurrency and additional checks remain pending at this snapshot.

Evidence Exact absolute paths and full SHA256 hashes are retained in `snapshot.json`; raw evidence remains in the referenced directories. The diagnostic and its original diagnosis packet remain unchanged. This document is an additive point-in-time record.
