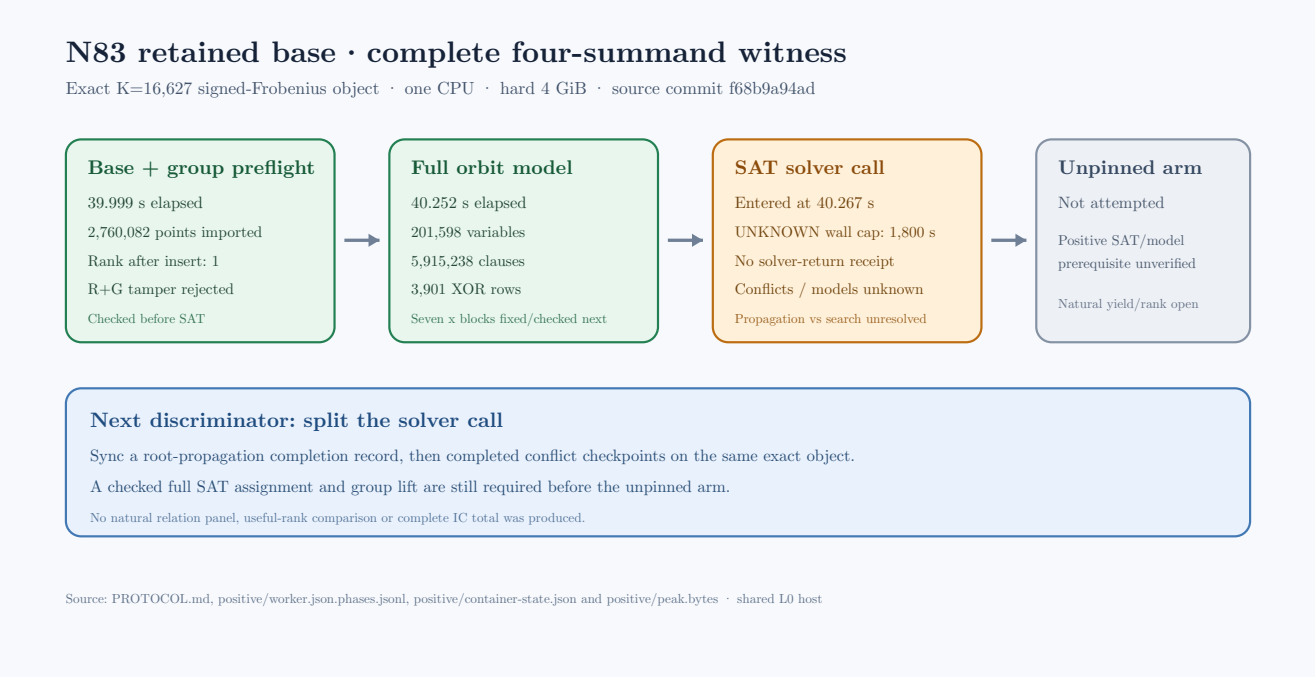
N83 complete-witness result

The exact K = 16,627 signed-Frobenius base imported and passed group preflight. Its full four-summand orbit-domain model reached 201,598 variables, 5,915,238 clauses and 3,901 XOR rows. All seven x blocks were checked or pinned before SAT entry at 40.267 s. The one-CPU, hard-4-GiB positive arm reached its 1,800 s outer cap without a solver return (`UNKNOWN_wall_cap`), exit 124, no OOM, peak 2,661,351,424 bytes. The dependent unpinned arm was not attempted.



The synced phase file, exact input and source hashes, container state and commands are in `research/n83_k16627_m4_witness_20261018/`. The solver call is the localized remaining stage; propagation versus conflict search is unresolved. No natural relation panel, useful-rank comparison or complete index-calculus total was produced.
