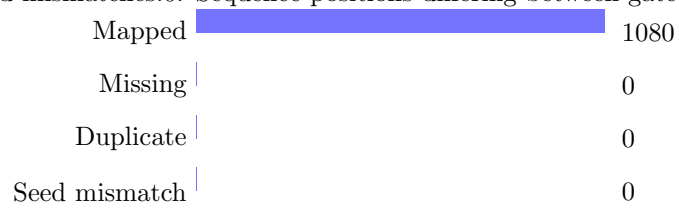
Retained p739 plan enrollment audit

Observations only. This native checker compared retained gate, cohort16 and fresh-session plans. It executed no solver, generated no plan and took no new measurement.

Gate workloads:60. Resolved arms:3. Gate executions:1080. Matched executions:1080; missing:0; duplicates:0; seed mismatches:0. Sequence positions differing between gate and cohort subset:900.



Full workload and resolved arm objects are compared, including original IDs. Algorithm seeds are parsed as exact unsigned64bit integers. Mapping rows retain both sequence positions and both seed values. This verifies membership only; it is not general admission or authority to launch the remaining1200 targets.

Input integrity

Gate: `bc57819e43862f5d9c9aee0f13b983fec186b2dd14dbc8b921d8999acc4b6776`

Cohort16: `35e6311a7105a29c2459543ad0b281ed91e43aa63a99f66226f95a1f3c9cc2ba`

Fresh: `bc57819e43862f5d9c9aee0f13b983fec186b2dd14dbc8b921d8999acc4b6776`

Fresh full plan equality: true. Gate-to-cohort bijection: true.

Full machine-readable evidence and all1080 mapping rows are in audit.json; mapping.svg contains the corresponding count graph.
