ecbench_b12_pin_l0 run report

Session ECBS1hc4dcc1359e8e used spec ECS1ha1eede873cd7 (SHA-256 a1eede873cd719c4d39473739efde84c36de7eb741839fdff740b68945d81389) and binary SHA-256 56a532e119bb6e58df188afc25d6bc8495fd345a643a8c541f136481f1090324. The host was Intel(R) Xeon(R) 6975P-C. Isolation earned L0 (–cpus none –allow-busy); wall time is descriptive. All curve registry flags were false.

The session requested 324 runs: 324 verified. Three public targets per curve, one warmup and five measured rounds compared rho-neg, ic-native, and an A/A rho arm. The saved comparison has 90 measured IC/rho pairs; its counted S ratio is 7.892. Both arms have unpriced native counters, so that ratio is a lower-bound diagnostic. All six curves have comparable verified IC/rho pairs.

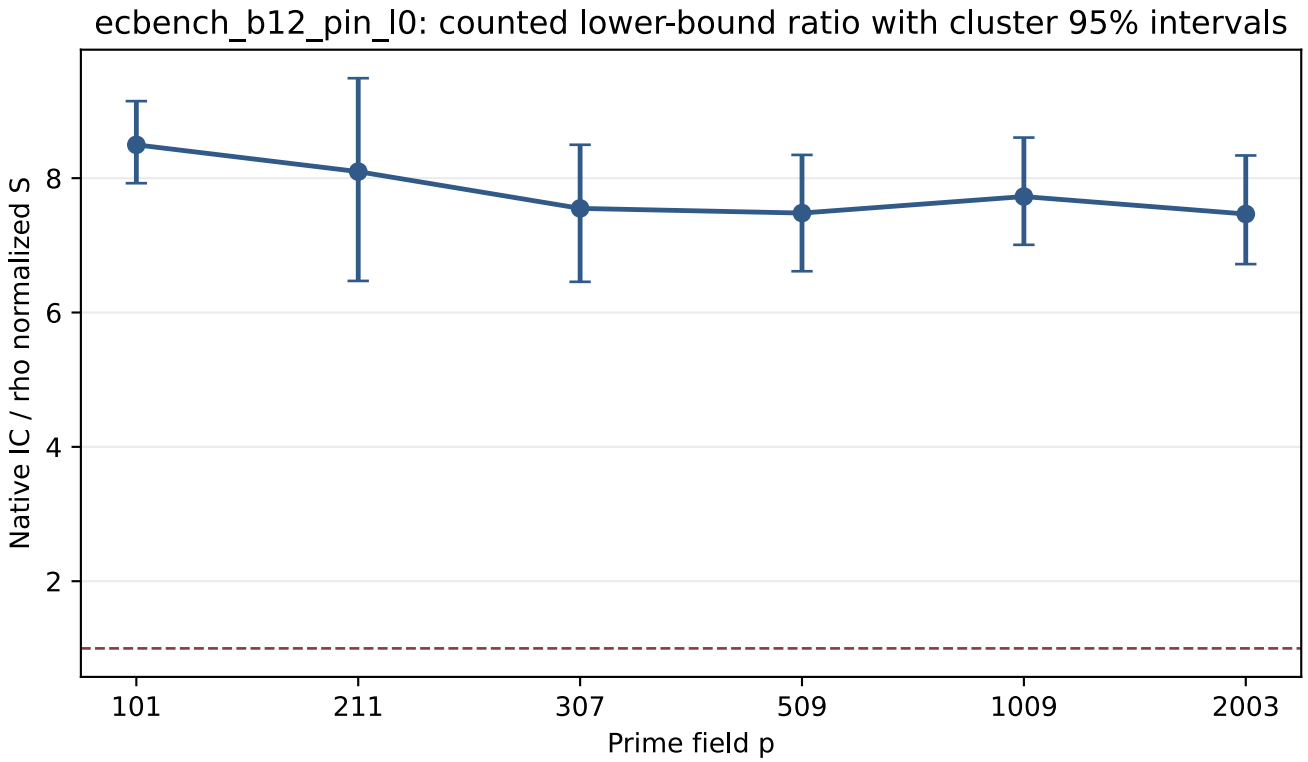

Figure: per-curve counted S ratios and cluster 95% intervals from the saved ecbench comparison. L0 wall time is not admitted; no twist method ran in this session.
