Native input-custody: independent source review

T-1242 review packet

1 November 2026

The exact published Rust module rebuilt offline in a fresh directory. All35 producer fixed controls and37 independently authored fixed controls passed their expected outcomes. The review exercises the actual composed input-qualification entry point, not only its parser.

Checked correspondence. Recursive decoded-key duplicate rejection, complete JSON consumption, caps, canonical path spelling, symlink/hardlink rejection, regular-file types and modes, exact flat inventory, file digests and observed descriptor/path stability. Independent composition controls reject writable mounts, wrong nonce, failed transport, extra diff, duplicate escaped expected key and altered gate permissions.

Boundaries observed. Distinct Unicode normalization forms remain distinct. Empty files are accepted with matching pins; empty inventories are rejected. Pins are externally trusted. The accepted result does not assert runtime qualification.

Blocking and race interface. File metadata checks and later opens are separate. A replaced pathname can block at open before identity checking; filesystem metadata, directory enumeration and reads can also block. Byte caps are not deadlines. Directory listing has no independent entry-count cap. No blocking or race experiment was run. Future supervisor integration must enforce bounded execution and its ownership model externally.

Independence. Source-first review followed publication b4684a67ca626d338099525aefae817a3d276e78. Reviewer authored the imported prior adapter, not this custody module; no blindness claim. Reviewer-only borrow-check failure and an initial38-versus37 count-predicate failure are preserved. Exact subject source remains unchanged.

Evidence. Detailed source findings and primary references are in REVIEW.md. Standard JSON, raw controls, source pins and offline commands accompany this report. Full native supervisor, runtime archive/admission, daemon mount binding and cleanup remain separate. No gate, daemon, scientific workload or cloud operation was executed.
