Combined signed and Kummer qualification wrapper

[pcc:unverified] T-2093; source-only prospective implementation. No compiler, tests, payload or lock generation. Independent review pending.

T-2093 · Source-only combined qualification wrapper

1800s shared: root staging/build + private driver staging + driver/adapter builds
Actual published generated lock required; historical crates preserved

600s shared: 28 signed + 7 Labels + at most11 full739 driver calls
Forced fallback / zero-vector probes + four adapter negatives + postchecks

Admission closed: deadline, lock, publication, ledger and ownership unbound

Concrete changes

The signed producer's native launcher, lease heartbeat, supervisor permit, InvocationID/cgroup ownership, cleanup and durable sealing machinery are reused with fresh identities. The worker keeps exact28 signed rows and final completion summary, identity/duplicate coverage, and seven Labels cases. A separate private source tree stages the49 exact driver inputs and fixture JSONL records. Its lock must be the actual generated and published driver lock; no root-lock substitution or historical-crate replacement. Root, driver binary tests and adapter dependency-library tests all share1800seconds including staging and verification. Eight exact test invocations share600seconds including cleanup and postchecks. Driver output acceptance requires original/disabled/observed complete-row equality, verified fixture scalar and eight fixed fault results. Forced fallback reconstruction and zero-vector lift have their own result. Four adapter negatives each require one passing exact test. Source and binary hashes remain checked.

Preserved limits and pending bindings

Total2400seconds,2CPU16GiB zero swap512tasks, one attempt/no retries; original output/workspace bounds retained. The limits may cause failure and imply no completion prediction. Full1260cohort unchanged; qualification is not that cohort. No admission.json exists. Draft release false; deadline, generated lock path/hash/size, source publication, ledger, lease, fresh cache and release receipts remain unset. Loader rejects absent binding before launcher mutation. Final coordinator-authenticated, independently reviewed published admission is still needed.

Source provenance and next review

PLAN.md and input-bindings.json identify the three exact predecessor packets. Individual source patches show modifications; panel_acceptance.py and stage_driver.py supply new mechanics. KB unavailable; exact local primary-source fallback, no novelty claim. Cargo dependency package-target resolution, compilation and native branch coverage remain untested. Next is independent source review, then actual lock binding and authorized qualification separately. No old evidence changed.
