Pivot/swap operational renewal

[pcc:unverified] T-2109. Source-only preparation; no compilation, tests, materialization or payload. Independent review pending.

T-2109: pivot/swap operational renewal, source only

Pre900 ⟶ compiler600 (5 calls /17 names) ⟶ post900 seconds

Forecast1200 prior +128400 remaining =129600 campaign ceiling

Release false: confirm actual terminal ledger and independent review

Preserved source and bounded scope

All five Lean files, five-call sequence,17named producer/control readbacks, direct import bindings, runtime pins and prior source bindings are byte-identical to solve4-pivot-swap-replay-20261109. The retained import amendments are unchanged. Exact patches show executable changes only to fresh workspace/phase identities, deadline and campaign ledger forecast. Phase caps remain900pre,600compiler,900post, totaling2400seconds;1CPU,8GiB,zero swap128tasks,no automatic retry. Native ownership and cleanup code is retained. These are caps, not completion predictions.

Forecast versus admission

Confirmed campaign ceiling129600seconds and deadlineNovember11,2026noonUTC. Proposed prior charge1200 assumes terminal accounting for two600second attempts; proposed remaining128400 is before this attempt. This packet does not charge or reserve work. If actual ledger differs, fail closed and prepare reviewed corrected bindings. Historical attempts and expired campaigns remain unchanged. Release template remains false, with final receipt/lease/publication fields null. Root must verify serial terminal custody, actual ledger, fresh paths/units, live resources and lease, then publish exact reviewed release before any invocation. The new units and paths were absent during preparation; repeat that observation at admission.

Evidence and next step

renewal-bindings.json records12unchanged file hashes and the campaign authorization. PLAN.md preserves the predecessor mathematical scope and exclusions. Source patches, forecast CSV and report.json distinguish preparation from execution. The shared KB was unavailable; exact local primary protocol/source used without novelty claims. Independent review precedes any kernel/axiom validation.
