Disjoint enrollment preparation

Preparation only: one native plan-only invocation and retained-slot verification. No empirical solves or new cost result. Clock qualification, scientific admission, budgets and analysis/export integration remain pending.

The retained seven original plans are partitioned into eight enrolled plans: p739 gate (60 workloads), cohort16 remainder (120), and six unchanged plans (180 each). Complete workload objects, methods and exact integer slot identities were checked by native preparation. Sequence and workload-array positions may differ and remain recorded in the mappings.

Workloads	1,260
Planned slots	22,680
Measured arm slots	18,900
Warmup slots	3,780
Measured candidate/reference pairs	6,300
Empirical solver executions	0

Evidence and limits

The request and native outputs are retained byte-for-byte. The certificate and mappings preserve both original and enrolled identities. The separate upper gate is not included in this partition. Earlier p739 observations and their invalid clock status are not changed. This packet contains no cost estimate and authorizes no execution.
