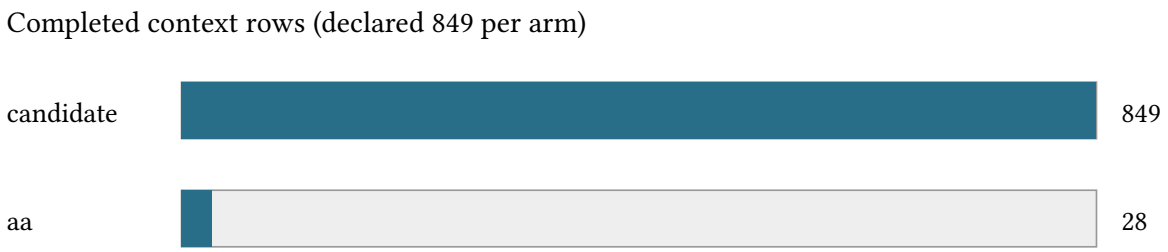
Fused operator: original cap reconciled

2026-11-01 · Recorded candidate completion and partial A/A coverage

The original 3,600-second invocation ended at its preserved deadline. Producer and follower both returned 124; both process handles are absent. No restart, budget extension or replacement invocation occurred.



Recorded completed work. Candidate: 849 contexts and 17,124 products, including 16,164 archived products and 960 carry products. Recorded controls: 68,496 rejected mutations, 51,372 equal-wrap rejections and 1,920 radix-guard rejections. A/A: 28 contexts, 2,750 archived products, 11,000 rejected mutations, 8,250 equal-wrap rejections. All 28 corresponding payload hashes match. These figures are recomputed from the complete raw rows, not forecasts.

Coverage. The declared two-arm panel has 1,698 contexts and 34,248 products. Completed: 877 contexts. The remaining 821 lack completion receipts. The unfinished attempted-row count is unknown because no per-row start receipt was emitted. No A/A carry row completed. Full A/A and full-panel export are absent; the integration execution gate remains closed.

Custody and inspection. All 431,414,955 raw bytes are retained, with no partial trailing row. Reconciliation checked row order and declared seeds, payload hashes, matched A/A payloads, fixed recorded kernel counts and native multiplication descriptor sums. Ten frozen source locks and two input locks were reverified. This audit reads recorded data; it does not replay kernels or replace the producer's independent-reference checks with new trials.

Provenance. Predata commit 3e77b2c. Original producer 2245648 and follower 2245741. Deadline epoch 1793576987.8451536. Native exit-code.txt,

postprocessor-exit.txt and postprocess-state.json establish terminal status. terminal-reconciliation.json contains all row offsets and hashes; reconcile_capped.py is the separate custody script. Historical launch reports retain their original observation dates.

Next. Preserve this invocation and all failures. The candidate arm provides complete recorded component coverage, while the missing A/A portion stays explicit. Identify the cost of preparing and serializing independent receipts before designing any fresh full-cohort validation; a new run would require its own approved finite budget and committed contract. Recursive inverse and pivot constructions remain syntax-checked, unexecuted follow-up work.

Counts retain their own units; no elapsed-time or peak-memory comparison is inferred. The displayed graph reports completed rows only, with no statistical uncertainty model or extrapolation.
