Affine prospective budget amendment

affine-mul-budget-amendment-20261109

Source-only; no compiler, payload or measurement executed.

1. Reduced the proposed cumulative allowance from10800 to10200seconds by reducing the shared compiler phase from9000 to8400seconds. Precheck and postcheck remain900seconds each. Derived work/cleanup boundaries use the new total.

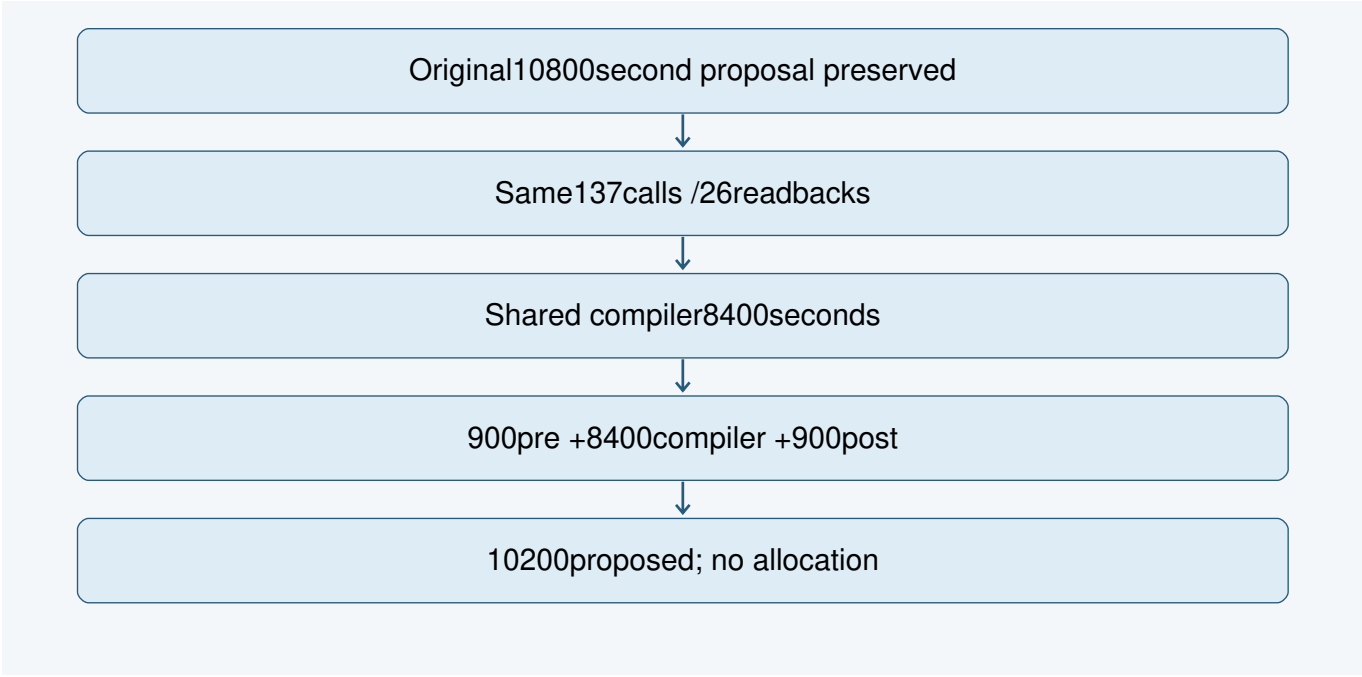
2. All137 compilation calls,26named readbacks and every Lean source file retain exact bytes. The120second individual-module cap remains inside the shared compiler cap. No source, control or sample is dropped.

3. Full16736-file baseline custody, runtime pins,1CPU8GiB,no swap,one-attempt policy and absolute deadline remain unchanged. Original proposal/freeze7347919c is preserved; both proposals use the same exclusive native workspace, so the amendment grants no extra attempt.

4. The parent planning rationale makes room for the600second cast successor,120second fixture staging,1800second cached suite and60second lock preparation, with180seconds planned contingency. These are planning figures, not observed runtimes or a current allocation ledger.

5. Freeze accounting fields remain null and the release template remains false. The global43200second allowance, CPU/RAM caps and absolute deadline are not increased. No runtime-fit claim is made.

Argument and custody map



Remaining step: Independent reviewer checks the exact budget delta; coordinator reconciles actual ledger and selects one proposal before publication and release.

Inputs and precise hashes: amendment.json and predecessor-freeze.json.

Exact previous reviewed runner/freeze used; no new research or novelty claim.

Source-only budget amendment; no execution, reservation, dependency resolution or compilation.
