Factor bases: solve cost by size and symmetry

callgrind Ir of one frozen solve (log scale, shorter is cheaper), snapshot e2e0e2e0 · grey = matched rho on the same curve · right: index since first tracked

Every kernel, by area

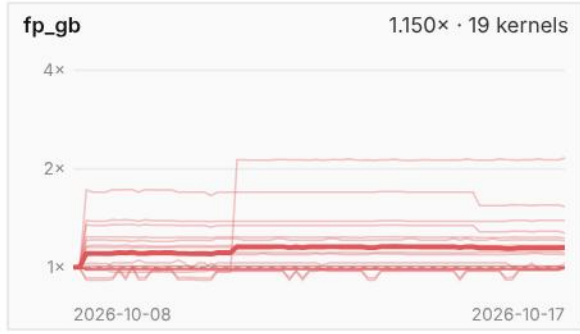

chained lr index over 76 snapshots (shared log scale, above the dashed line = fewer instructions). Thick line: the area index. Red ring: latest step more than 8 % more expensive.

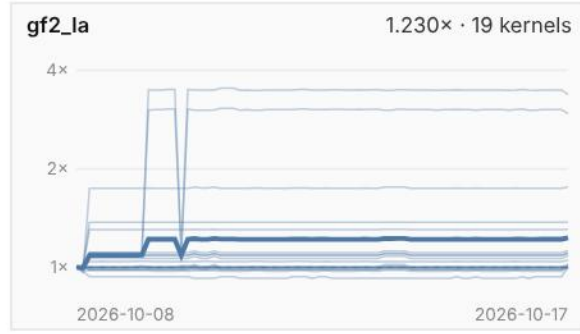

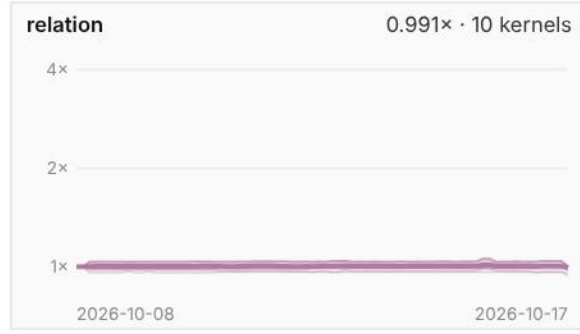

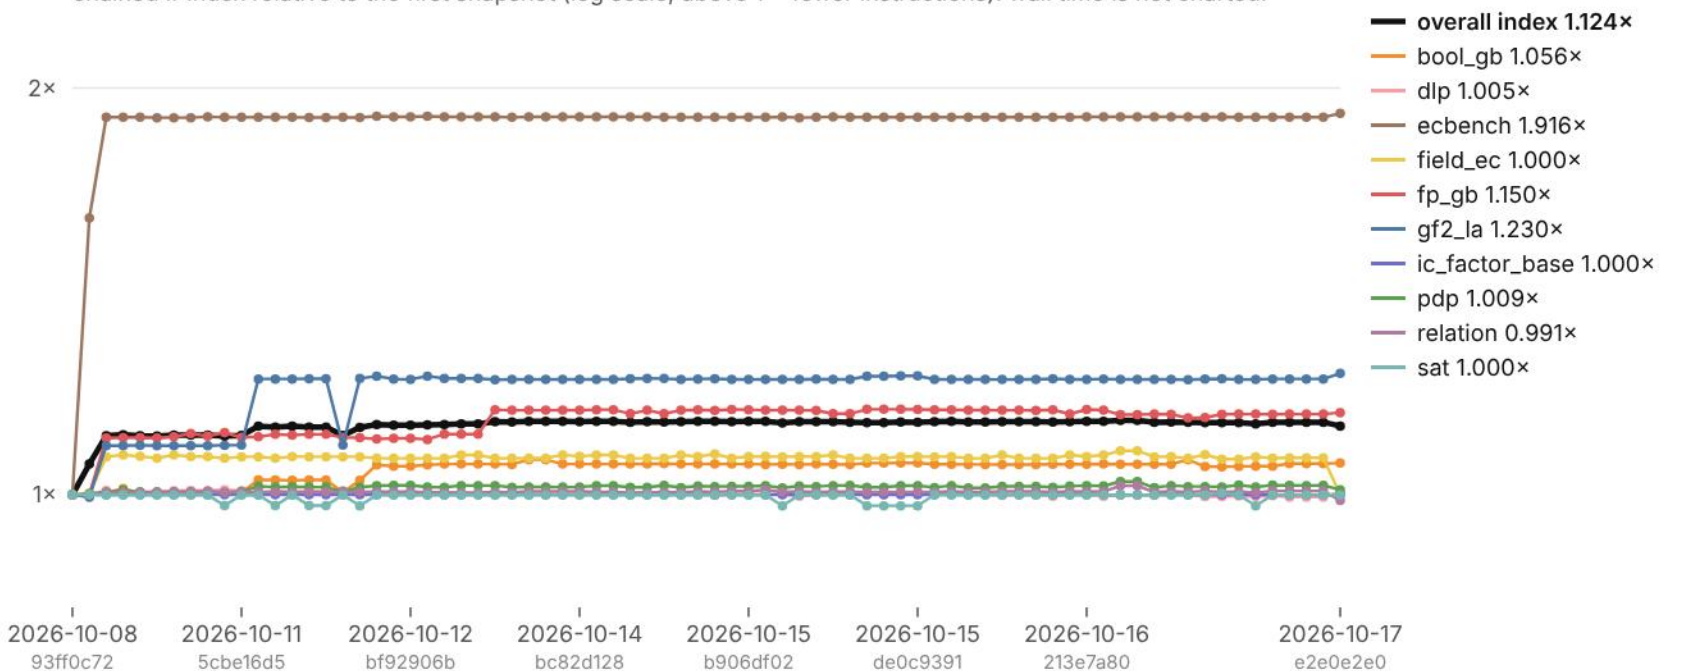

crypto: perfbench + ecbench instruction-count history

chained lr index relative to the first snapshot (log scale; above 1 = fewer instructions). wall time is not charted.

76 snapshots; generated by scripts/perf/perfhistory.py render
