Source-derived common 2+2 coefficient slice

`projective-law-coefficient-slice/v1`. A restricted parser extracts seven field expressions from the Rust common 2+2 function and their seven Lean counterparts. It substitutes earlier assignments and compares expanded integer polynomials. All seven pairs match; subtraction-to-addition mutations in the Rust and Lean B coefficients are rejected.

Rust / Lean	Monomials	Equal
dq / dq	2	yes
dr / dr	2	yes
ds / ds	2	yes
dt / dt	2	yes
bcoef / B	7	yes
acoef / A	12	yes
ccoef / C	8	yes

This check covers the named coefficient slice only. It does not establish Rust operational semantics, weighted-coordinate validity, or the Jacobian group law. The existing 1,260-target cost ratios remain unchanged. The accompanying JSON records source hashes; CSV retains one row per pair.
