Attempt02: positive replay, incomplete control contract

2026-10-29; uniform-20261029

At input `42b72c3a2feb`, the corrected independent audit passes96 arms, 896 source recoveries,210 comparisons,536 states and172 failed recovery queries. Joint original/reduced counts are0/0. The runner exits2: false-row replaced an already empty first row list by empty, so the changed-payload guard correctly rejects a no-op. No successful control rejection/backend completion is claimed. Versioned v3 finds an actual nonempty query and removes one real row; this was compiled and committed at `0e88deaae36a` before a full third execution. The original v2 source/payload remain. All97 producer files and the positive receipt match the final successful run byte for byte. The full record retains all policies/losses; the graph below shows the same audited response profiles.

Execution contract. Same full preregistered96/896/210 workload, deterministic response census, existing local host/two workers,600s command caps, no clock or speed claim. Raw inputs/commands/exits and precise failed payload are restored by `validation/uniform-20261029/restore-runs.sh`. The official checkpoint gate passed before this scientific execution. No private key/token enters the record.

Source links. `UNIFORM_YIELD_20261025_PROTOCOL.md`, dated audit/control correction contracts, and final `reports/uniform-20261029/README.md`. The broader useful-yield/degree/source-DLP objective remains open.
