Actual E/F5: y²=x³+1, #E=6, r=3
Prime/coprime/divisibility and r not dividing q−1 checked
Actual 3P=O gives diagonal S3=0
x=0 or x³=1; y²=1 or y²=2
x²⁵=x and y²⁵=y
Frobenius² fixes every actual 3-torsion point
Actual P=(1,beta), beta²=2
Exact order 3; Frobenius(P)=−P≠P
Outside the actual F5 point image
Every k: full actual torsion fixed
iff k even iff 3 divides 5^k−1
Actual finite-extension point descent
Chosen field K, #K=5^k, compatible embeddings
Every k>0: actual GaloisField 5 k
Cardinality 5^k and an actual embedding into closure
Its point image satisfies the same exact criterion
Qualified actual-case theorem, no assumed torsion basis
Generic rank/cardinality and all-p<500 census remain open
Local checking; signed standing unverified
