Address-only msolve fault-site diagnostic

Four separately frozen local calls inspect the unchanged0.6.5source beyond the earlier combined-sanitizer first error. ExactLA2ordinary aborts134 with an ASAN READ SEGV at la_ff_32.c543; LA1ordinary passes its exact known-answer basis, and both saturation calls hit5swatchdogs. [pcc:unverified]

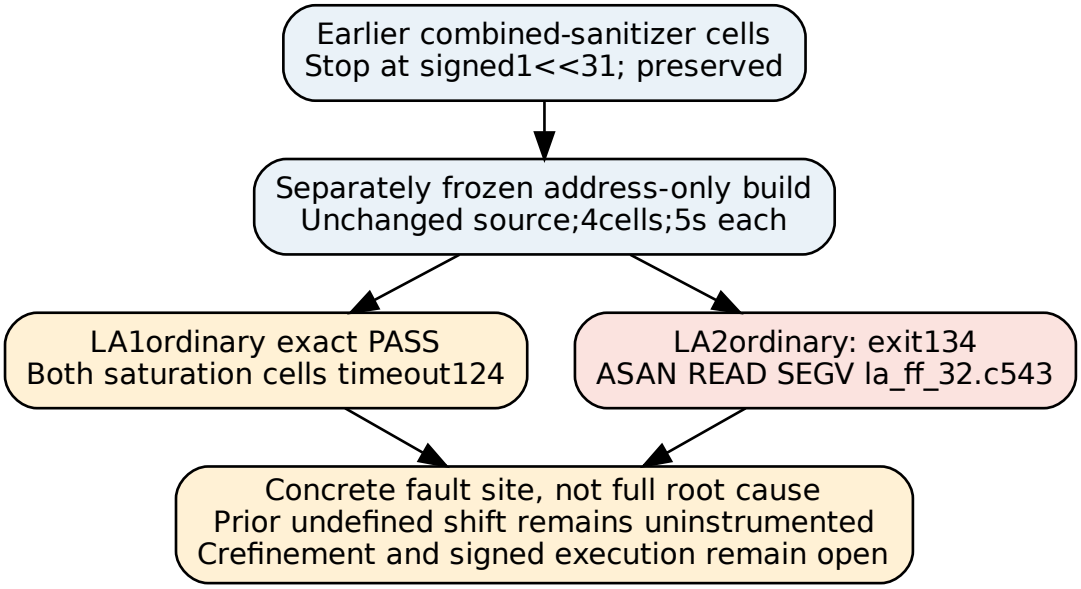

Figure 1: Separately frozen calls and scoped fault-site observation. [pcc:unverified]

Actual outcomes and source boundary

Exact linear algebra	Ordinary	Saturation
1 sparse/dense	exit0; exact basis check passes	timeout124 at5s
2 sparse	exit134; ASAN READ SEGV	timeout124 at5s

The ASAN backtrace identifies the 17-bit sparse reducer at src/neogb/la_ff_32.c:543. The path includes the exact sparse echelon routine, the sparse linear-algebra dispatch and core_f4. This is the observed fault site of the instrumented execution, not a complete root-cause or well-defined C-semantics proof. [pcc:unverified]

The earlier signed1shift31 is not instrumented by this build, and the source remains unrepaired. Omitting that check does not make the C execution defined. All original source files remain byte-equal to the pinned official0.6.5tarball. The ordinaryLA1known-answer check validates normalized basis equality, input reductions, S-pairs, staircase3 and three Boolean-candidate zeros. No fullF65537²census or generic solver refinement is established. [pcc:unverified]

Protocol version 2 (hash dc99c976) freezes all four cells, with a five-second limit per call and twenty-second batch allowance. Source commit a549657b precedes affected data. Flow: 4 planned, 4 attempted, 2 completed, 2 timeouts and 0 excluded. The previous 8combined-sanitizer cells and original2failures remain unchanged. No native call or parser was rerun under the earlier protocol. [pcc:unverified]

The export passes schema, protocol and all-file hash validation. Packet PCC-20261110-abac7a is not_covered: unsigned artifact attestation lacks independent signed recomputation/replay. No paid compute, timing, statistical, other-machine or Crefinement claim. The existing Lean ideal-containment/saturation-domain proofs retain their exact scope. [pcc:unverified]

All28raw files are archived losslessly with per-file hashes and byte-equal roundtrip checks. Run `python3 ../materialize-raw.py .` in this study before checking the export from a fresh checkout; unequal existing files are rejected. Exact sources and outputs: protocol.json, provenance.json, frozen-files.sha256, export.json and evidence/runs-inventory.json. [pcc:unverified]

Source review remains pinned to upstream CLI, coefficient-width/matrix dispatch and exact reducer paths, plus official GCC sanitizer options. KB absent/wrapper127; bounded primary/source fallback. Next source audit: check the basis-index rewrite against the coefficient-table lookup and current upstream correction before any separately preregistered patch experiment. [pcc:unverified]
