Actual iteration on Z/p
f(x)=x+h(x)+1; h(x) in 0..19
T = least repeated-state index
Strict natural path lift S, S(n) <= 20n
Repeat: p divides positive S(T)-S(i)
p <= 20T; T <= p
Distinct nonzero increments 1..20
Actual indegree mean 1; variance 19/20
Actual independent uniform node-label PMF
p <= 20 E[T]; E[T] <= p
Euclid: arbitrarily large prime p
For each real C, some E[T]^2 > Cp
Fixed-support obstruction only
Random-table heuristic / averaged mixing remain open
